

April FFB beam test results

Xiang Zhang, UVa

April feedback tests:

<https://logbooks.jlab.org/entry/4288735>

<https://logbooks.jlab.org/entry/4288694>

Run 16070 and 16071- Octet pattern RMS results

240 Hz: HelBoard: 100us Tsettle, 4066.65us Tstable, Octet, 16 windows delay; HAPT command: "setTimeHAPT(30, 1400)"; VQWK vqwksamples=505.

16070: FFB is on and 16071: FFB is off.

Run	FFB	Δ rms (micron) 4a X	Δ rms (micron) 4a Y	Δ rms (micron) 4e X	Δ rms (micron) 4e Y	Δ rms (micron) 4aX - 4eX	Δ rms (micron) 4aY - 4eY
16071	off	6.3 ± 0.1	4.5 ± 0.1	5.8 ± 0.1	5.2 ± 0.1	0.86 ± 0.02	0.93 ± 0.02
16070	on	6.3 ± 0.2	21.4 ± 0.6	6.3 ± 1.7	24.4 ± 0.7	0.85 ± 0.02	2.80 ± 0.08

Octet pattern difference

FFB increases the width in vertical direction

```

Looking for noise coherent with flip frequency

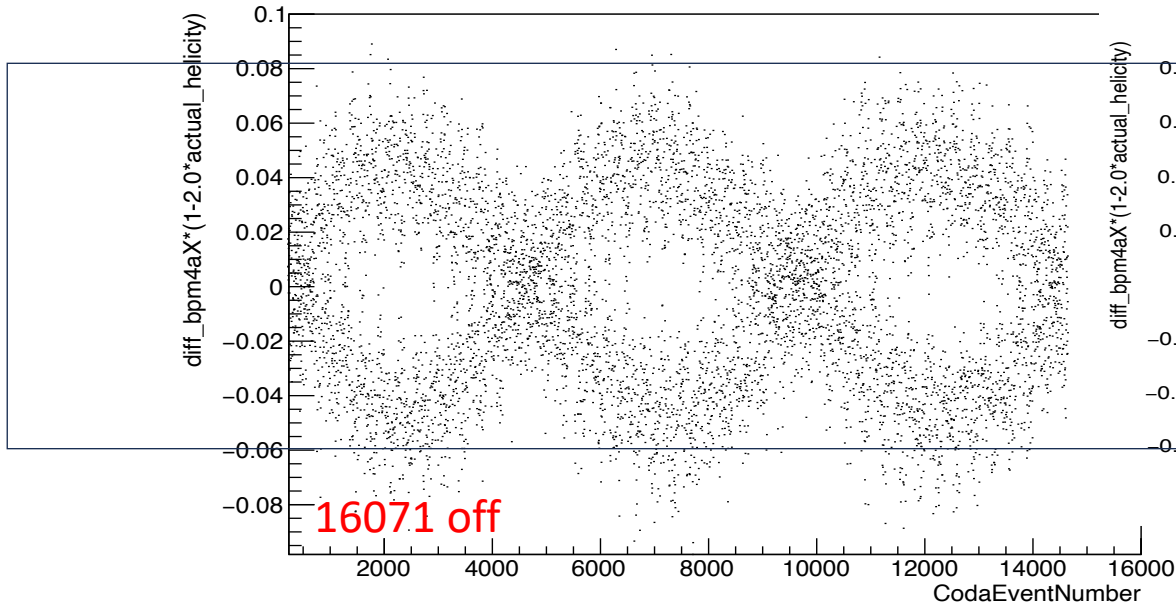

- Look at “pair difference”. For 240 Hz flip, this mean 4 windows (two pairs) per 60Hz cycle
- Assigned polarization is in 2-quartet pattern (+--+--+)- or complement
- Sign correct each pair, so that our pair difference is always calculated for two windows as (+,-) (+,-) (+,-) (+,-)

Up-down pattern demonstrates noise is at 60Hz frequency

To put in context: scale FFB OFF to plot of ON

diff_bpm4aX*(1-2.0*actual_helicity):CodaEventNumber

diff_bpm4aX*(1-2.0*actual_helicity):CodaEventNumber

horizontal: 60 Hz separation is only slightly reduced, but variability or phase slip looks different

16071 off

diff_bpm4aY*(1-2.0*actual_pattern_polarity):CodaEventNumber

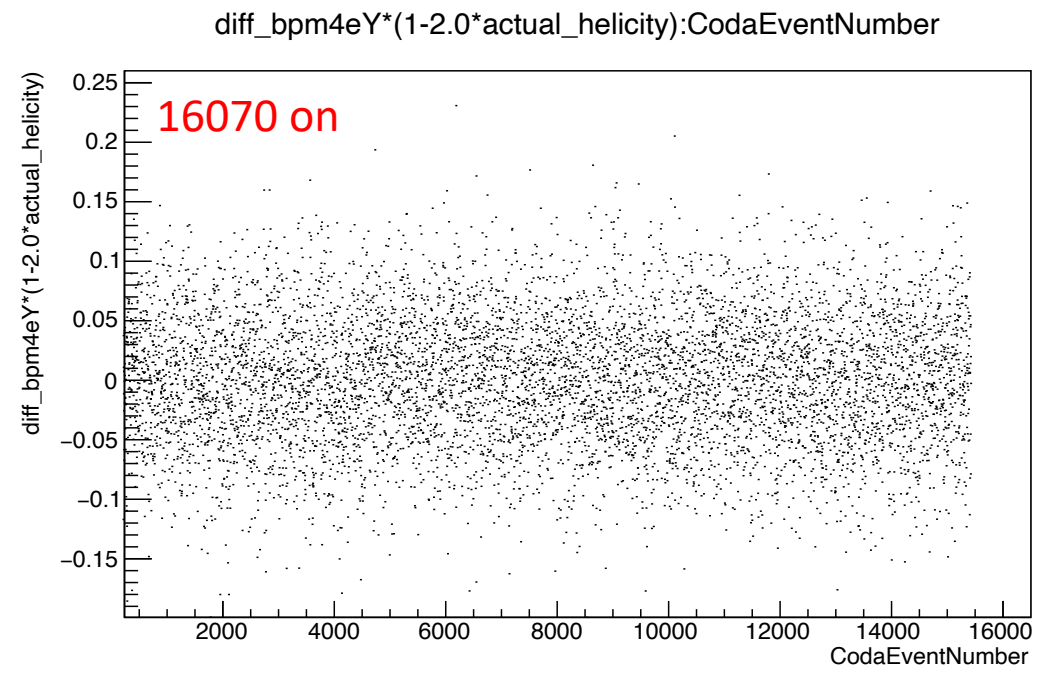

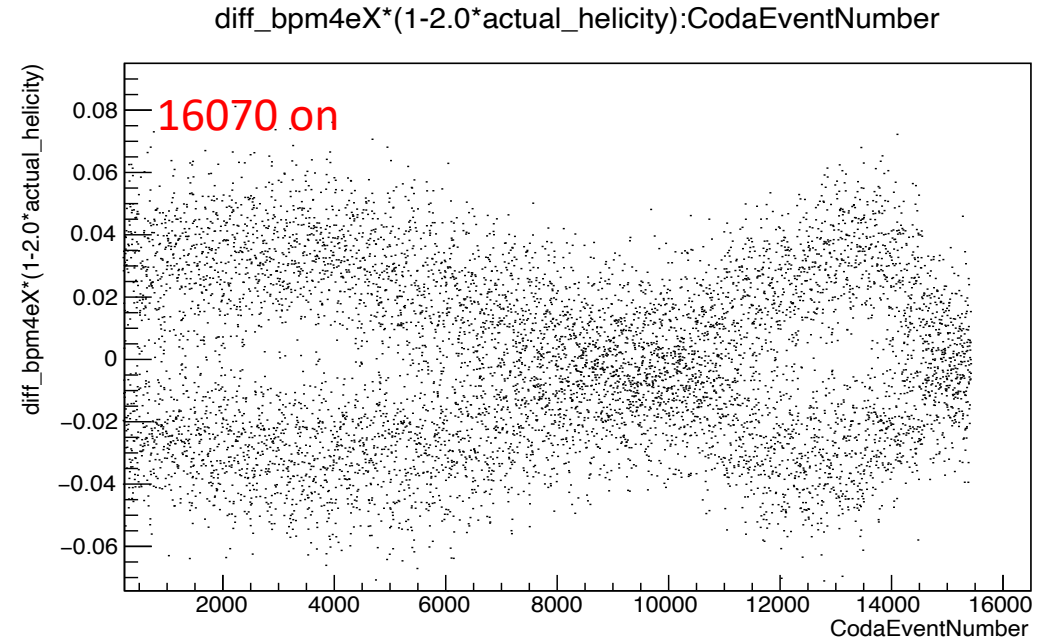

diff_bpm4aY*(1-2.0*actual_pattern_polarity):CodaEventNumber

vertical: 60 Hz separation is invisible but dominant uncorrelated noise is introduced

Pair results for 240 Hz

Run 16070 and 16071- pair difference mean results

240 Hz: HelBoard: 100us Tsettle, 4066.65us Tstable, Octet, 16 windows delay; HAPT command: "setTimeHAPT(30, 1400)"; VQWK vqwksamples=505.

16070: FFB is on and 16071: FFB is off.

Run	FFB	Δ mean (micron) 4a X	Δ mean (micron) 4a Y	Δ mean (micron) 4e X	Δ mean (micron) 4e Y
16071	off	0.2 ± 0.4	0.1 ± 0.3	0.2 ± 0.4	0.1 ± 0.3
16070	on	-0.1 ± 0.3	-0.4 ± 0.6	0.1 ± 0.3	-0.5 ± 0.6

pairwise difference

This are small relative to beam noise averages

Phase slip:

240 Hz: HelBoard: 100us Tsettle, 4066.65us Tstable,
Octet, 16 windows delay; HAPT command: "setTimeHAPT(30,1400)";
VQWK vqwksamples=505.

4166.65 us repeat vs. 4166.66 us 240 Hz.

Phase slip = 4 ppm / cycle, so one wave in 250,000 cycles, 1041 seconds.
This run was only about 60 seconds long, so the phase drift is external,
at about 1 wave per 10000 events, or about 100 ppm / cycle
This is probably due to line noise drift.

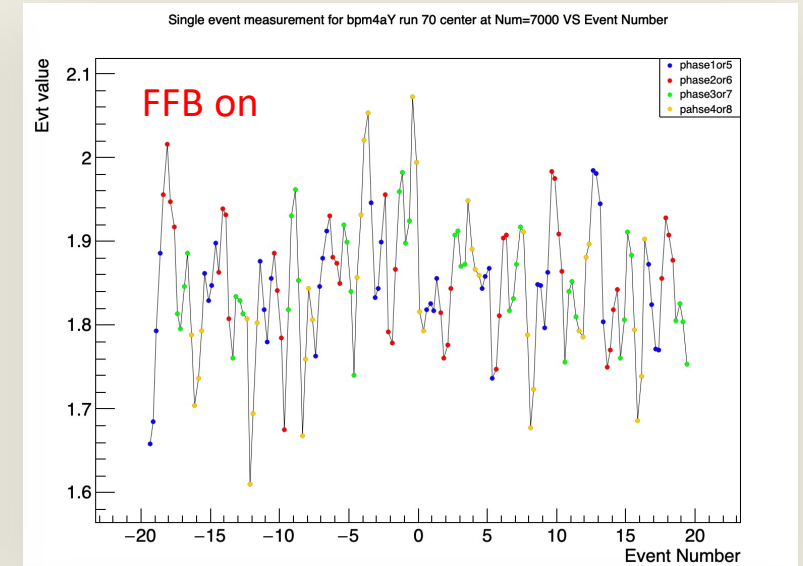

The result for 16070 FFB on

- We can see there are sequence for each measures and the 60hz noise.
- Colors indicate phase of 240 Hz measurement relative to 60Hz:
blue, red, green, gold
- Each 240Hz measurement window plotted as 4 “subblock” measurements, so effectively 960Hz data points

16070 and 16071 position bpm4aX and 4aY 240 Hz

- Here are the position plots for bpm4aX and bpm4aY.
- The one label as run 70 have FFB on
- The on label as run 71 on the bottom have FFB off
- 60 Hz noise apparent in X for OFF/ON, and Y for OFF. With FFB ON, the Y position has large noise of higher frequency, and is not dominated by 60 Hz

Asym for bpm1X (XP-XM)/(XP+XM) for run 16071 FFB off and 16070 FFB on. Frequency 240 Hz

A single BPM wire pair, at 1H01, is the only other readout. It also shows 60Hz noise for ON and OFF. (Rotated wires, so this combines X and Y dimensions. FFB OFF is a little scrambled.)

Single event measurement for (bpm1XP-bpm1XM)/(bpm1XP+bpm1XM) run 71 center at Num=7000 VS Event Number

Single event measurement for (bpm1XP-bpm1XM)/(bpm1XP+bpm1XM) run 70 center at Num=7000 VS Event Number

RMS for multiplet differences in Run 16076 and 16077 1920 Hz

FFB	RUN mul	Δ rms (micron) 4aX	Δ rms (micron) 4aY	Δ rms (micron) 4eX	Δ rms (micron) 4eY	Δ rms (micron) 4aX-4eX	Δ rms (micron) 4aY-4eY
off	16076	3.8	3.5	3.7	3.8	1.9	1.9
on	16077	5.0	13.7	4.8	15.4	1.9	2.5

As before, noise in Y goes up when FFB is turned on.

At this integration period, noise also increases in X (but less so) when FFB is activated.

Run 16076 and 16077- multiplet difference mean results 1920 Hz

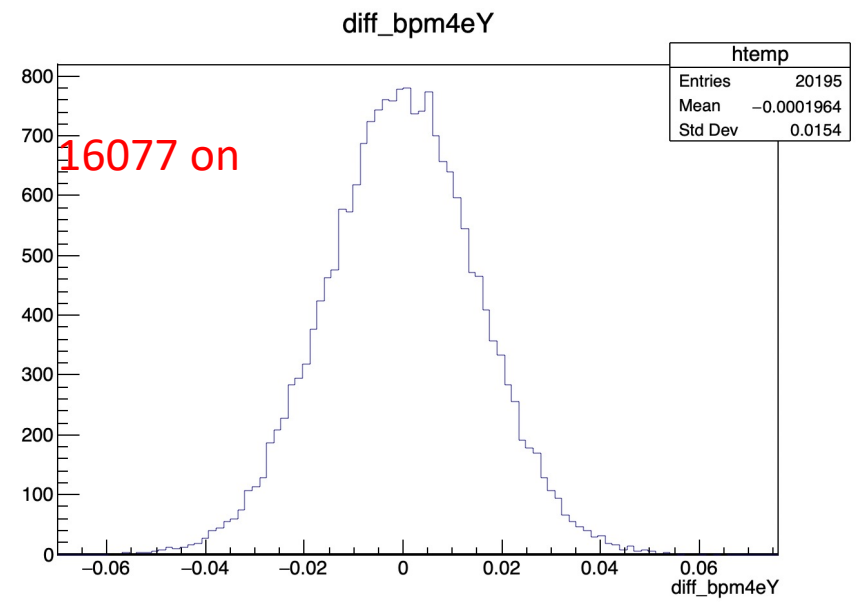

1920 Hz: HelBoard: 40us Tsettle, 480.85us Tstable, Octet, 16 windows delay; HAPTb command: "setTimeHAPTb(4, 180)"; VQWK vqwk samples=58.
16076 is FFB off and 16077 is FFB on

FFB	RUN mul	Δ mean (micron) 4aX	Δ mean (micron) 4aY	Δ mean (micron) 4eX	Δ mean (micron) 4eY	Δ mean (micron) 4aX-4eX	Δ mean (micron) 4aY-4eY
off	16076	0.06 ± 0.02	0.03 ± 0.02	0.09 ± 0.02	0.04 ± 0.02	-0.03 ± 0.01	-0.006 ± 0.010
on	16077	0.09 ± 0.03	0.16 ± 0.10	0.07 ± 0.03	0.20 ± 0.11	0.02 ± 0.01	0.04 ± 0.02

Multiplet results for 1920 Hz

Multiplet results for 1920 Hz

Multiplet results for 1920 Hz

Run 16077 FFB on diff VS Time: not clear about the result hard to see the pattern

diff_bpm4aY:CodaEventNumber {abs(CodaEventNumber-100000)<100}

diff_bpm4aX:CodaEventNumber {abs(CodaEventNumber-100000)<100}

Run 16076 and 16077- pair difference mean results 1920 Hz

1920 Hz: HelBoard: 40us Tsettle, 480.85us Tstable, Octet, 16 windows delay; HAPT command: "setTimeHAPT(4, 180)"; VQWK vqwksamples=58.
16076 is FFB off and 16077 is FFB on

FFB	RUN pr	Δ mean (micron) 4aX	Δ mean (micron) 4aY	Δ mean (micron) 4eX	Δ mean (micron) 4eY	Δ mean (micron) 4aX-4eX	Δ mean (micron) 4aY-4eY
off	16076	0.07 ± 0.03	0.03 ± 0.02	0.09 ± 0.02	0.04 ± 0.02	-0.03 ± 0.01	-0.06 ± 0.01
on	16077	0.09 ± 0.04	-0.16 ± 0.09	0.07 ± 0.04	-0.20 ± 0.10	0.02 ± 0.01	0.04 ± 0.02

RMS for pair differences in Run 16076 and 16077

FFB	RUN pr	Δrms (micron) 4aX	Δrms (micron) 4aY	Δrms (micron) 4eX	Δrms (micron) 4eY	Δrms (micron) 4aX-4eX	Δrms (micron) 4aY-4eY
off	16076	10.0	8.2	9.3	8.8	3.7	3.6
on	16077	10.6	25.4	10.2	28.5	3.7	4.7

1920 Hz

Pair results for 1920 Hz

Position bpm4aX vs time and bpm4eX – FFB off

- We can see there are some sequence in our result. Around 60 Hz.
- the Y range are the same we can see the width for 4e is bigger than 4a
- As before, colors represent 25% of 60Hz cycle, blue:red:green:gold
- 4x subblocks, so effectively 7680 Hz sampling
- Now some fast noise is apparent. Note phase slip in fast noise (amplitude modulates)

Single event measurement for bpm4aX center at Num=7000 VS Event Number

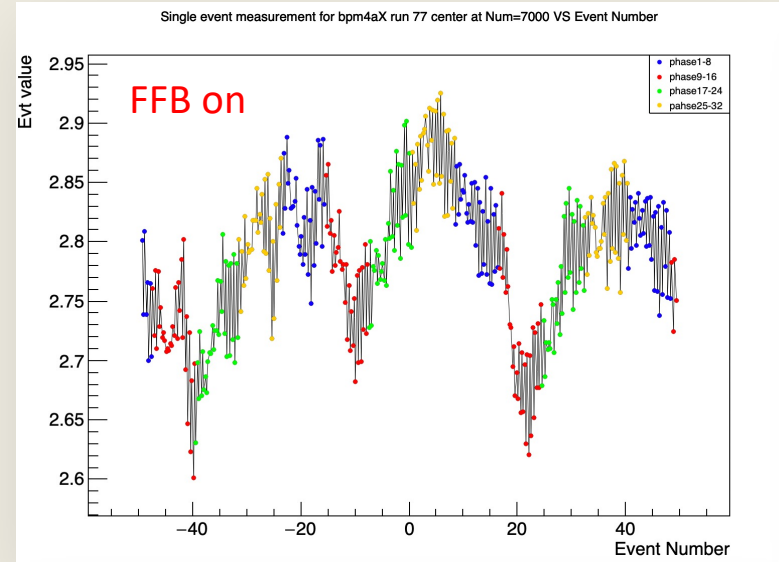

Single event measurement for bpm4eX center at Num=7000 VS Event Number

16076 and 16077
position bpm4aX and 4aY
1920Hz

- Here are the position plots for bpm4aX and bpm4aY.
- The one label as run 77 have FFB on
- For the ones on the bottom have FFB off
- We can see both of them have 60 noise and for FFB on the pattern is more chaotic
- Keep in mind: slightly different vertical scales for each plot

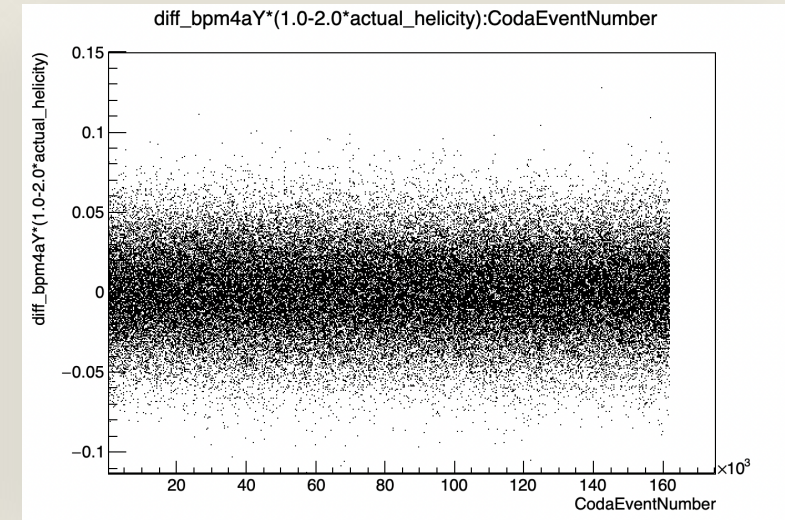

16076 FFB off Diff_bpm4aX and 4aY 1920Hz

- Here are the pair plots for bpm4aX and bpm4aY.
- The left are for CodaEventNumber around 7000 ± 100 .
- The right are all range.
- We can not see a clear pattern for the noise. It is hard to say we have a 60hz noise

16077 FFB on Diff_bpm4aX and 4aY 1920Hz

- Here are the pair plots for bpm4aX and bpm4aY.
- The left are for CodaEventNumber around 7000 ± 100 .
- The right are all range.
- We can not see a clear pattern for the noise. It is hard to say we have a 60hz noise

Asym for bpm1X (XP-XM)/(XP+XM) for run 16076 FFB off and 16077 FFB on. Frequency 1920 Hz

A single BPM wire pair, at 1H01, is the only other readout. Note that fast noise is also visible here, before raster.

Single event measurement for (bpm1XP-bpm1XM)/(bpm1XP+bpm1XM) run 76 center at Num=7000 VS Event Number

Single event measurement for (bpm1XP-bpm1XM)/(bpm1XP+bpm1XM) run 77 center at Num=7000 VS Event Number

Backup

BCMs in calibration run 16069

- I am currently utilizing scandata1 to plot current versus hw_sum. I identify the first pedestal using bcm_an_ds3 and then compare the remaining data with bcm_an_ds3 to determine their respective pedestal
- Asym for different bcm read out
- Beam current for 8 uA and 9 uA
- FFB on
- 240 Hz: HelBoard: 100us Tsettle, 4066.65us Tstable, Octet, 16 windows delay; HAPTb command: "setTimeHAPTb(30, 1400)"; VQWK vqwksamples=505.
