APS April Meeting 2016

Saturday–Tuesday, April 16–19, 2016; Salt Lake City, Utah

Session D1: Welcome Reception and Poster Session I (5:30pm - 7:00pm)

5:30 PM–5:30 PM, Saturday, April 16, 2016

Room: South Foyer

Abstract: D1.00039 : Generation and Characterization of Magnetized Bunched Electron Beam from a DC High Voltage Photogun

To maintain ion beam emittance and extend luminosity lifetime, the Jefferson Lab design of the Electron Ion Collider includes a bunched magnetized electron beam cooler as part of the Collider Ring. We are building a prototype magnetized gun using our newly commissioned 325 kV inverted-insulator DC high voltage photogun. This contribution describes planned measurements of beam magnetization as a function of bunch charge and average current, and laser beam size and magnetic field strength at the photocathode. Results will be compared to particle tracking code simulations. Photocathode lifetime at milli-ampere current will be compared to beam lifetime with no magnetization, to explore the impact of the magnetic field on photogun operation. Combined, these measurements and simulations will benchmark our design tools and provide insights on ways to optimize the electron cooler.

About APS

The American Physical Society (APS) is a non-profit membership organization working to advance the knowledge of physics.
