Solidworks geometry modifications:

Solidworks geometry modifications:

COMSOL materials:

- Stainless steel for all metal components with ϵ_r =1 and σ of 1.1E6 S/m
- Air for the vacuum surroundings.
- Alumina for the ceramic.
 - ε_r =8.4 and σ of 2E-12 S/m for the black.
- Rubber for the HV cable plug with ϵ_r =2.37 and σ of 1E-14 S/m .

Used the Physics AC/DC module to implement electrostatics: Grounded the chamber, anode, flanges and V=-300kV to the cathode assembly. The rest of the options are automatically setup by COMSOL.

COMSOL electric currents:

- Current conservation in all domains.
- Electric insulation at the outer air boundary.
- Initial value (of potential) set to zero by default.
- Ground 1 at vacuum chamber, NEGs, anode, flanges, upper shed.
- Electric potential at -300kV at the cathode, cathode shed and HV cable.

- ▼ Note: The property of t
 - Current Conservation 1
 - Electric Insulation 1
 - Parallel Initial Values 1
 - Ground 1
 - 📻 Electric Potential 1

Equation

Equation form:

Study controlled

Show equation assuming:

Study 1, Stationary

$$\nabla \cdot \mathbf{J} = Q_j$$

 $\mathbf{J} = \sigma \mathbf{E} + \mathbf{J}_{\mathbf{e}}$
 $\mathbf{E} = -\nabla V$

COMSOL mesh:

```
    Mesh 1
    Size
    Free Tetrahedral 1
    Free Tetrahedral 5
    Free Tetrahedral 2
    Free Tetrahedral 3
    Free Tetrahedral 4
    Size 1
```

- The mesh was separated into 5 pieces.
 - A general physics extra fine mesh was used.
 - Except for the field map interpolation cylinder shown in the bottom right close-up image, where an extremely fine semiconductor mesh was used.

COMSOL Study:

 The study solves for the electric field and potential including the effect of the conductivity of the materials using the currents module.

Step 1: Stationary

▼ Solver Configurations

COMSOL results:

- Plotted the potential and electric fields.
- The results shown up next are comparisons between the gun with only a cathode shed versus the gun with both a cathode and upper flange sheds.

COMSOL Electric field Norm at 3 points:

• The simulations show a lateral cross section. The electric field norm was obtained at three points around the cathode electrode for both cases.

COMSOL Electric field Norm:

• For the lowest point the electric field norm remains around ~6.8 MV/m for both. At the top right corner the presence of the shed produced a value around ~7.6% smaller than the no-upper-shed model.

COMSOL Electric field Norm:

• The effect of the shed on the gradient of the electric field norm |E| close to the upper flange.

No upper shed With upper shed.

Rubber plug-insulator interface:

• The potential and electric field along the rubber plug – ceramic insulator interface was obtained (as shown in the image as a red dotted line), plotted as a function of the height (y-coordinate) and compared for between the two models.

Potential:

The interpolated fields along the rubber plug-insulator interface shows that the presence of the upper shed decrease the linearity of the potential along the interface. The black line represents the ideal case.

Potential:

The interpolated fields along the rubber plug-insulator interface shows that the presence of the upper shed decrease the linearity of the potential along the interface. The black line represents the ideal case.

Electric field norm:

The interpolated fields along the rubber plug-insulator interface shows that the presence of the upper shed. The black line represents the ideal case.

Photocathode-anode line:

The data for the following plots was taken along a horizontal line from the center of the photocathode to the back of the chamber passing through the anode center as shown in the red line

Photocathode-anode line:

• This image shows the electric field Ey component in V/m as a function of position on the z axis.

Future steps.

- The anode !?
- The top of the flange is not detailed.
- The upper flange has little effect on the field inside the

Fin.
