# Draft Bubble Chamber Run Plan <br> May 1, 2018 

## 1 Pre Beam

### 1.1 Bubble Chamber Operation

- No beam
- Place neutron source about 1 m from chamber
- Enable bubble chamber and count for 30 min
- Place neutron source about 2 m from chamber
- Enable bubble chamber and count for 30 min
- Counts should be about factor 4 different

### 1.2 Background Rates

Background rates need to be established to $\delta R \sim 0.25$ counts/hour to be a perturbation on the statistical error for the lowest point. For a background rate of 4 counts/hour, this will require $\mathbf{4 0 - 6 0}$ hours. 10 hours is sufficient for the highest four points.

- No beam
- Enable bubble chamber and count

## 2 Commissioning

High rate checkout beam is $T=5.25 \mathrm{MeV}, 1 \mu \mathrm{~A}$. This should produce a rate of 1 event per 5 seconds ( $\sim 240$ /hour with 10 s recovery time).

- Beam width is $\sigma_{x, y}=1 \mathrm{~mm}$
- Beam is centered on radiator
- Beam energy width is $\sim 3 \mathrm{keV}$
- Beam energy is $5.250 \pm 0.005 \mathrm{MeV}$
- Bubble chamber recovery time 10 s

### 2.1 Establish Fiducial Region

- Bubble chamber active
- Establish high rate checkout beam for 20 min
- Adjust chamber height so fiducial region is in center of glass

### 2.2 Inactivity Test

- Bubble chamber set inactive
- Establish high rate checkout beam for 30 min
- No events should be observed on CCD

### 2.3 Establish Rate and Variation with Position

- Bubble chamber active
- Establish high rate checkout beam for 1 hour
- Move beam 3 mm in one direction
- Establish high rate checkout beam for 1 hour
- Rate should be nominally $10-15 \%$ lower

### 2.4 Width (also divergence) scan? TBD

- Bubble chamber active
- Increase width to $\sigma_{x, y}=2 \mathrm{~mm}$
- Establish high rate checkout beam for 1 hour
- Rate should be nominally $30 \%$ lower

### 2.5 Recovery Time Scan

- Recovery time set to 8 s
- Bubble chamber active
- Establish high rate checkout beam for 1 hour
- Normalized rate should be the same as initial rate
- Recovery time set to 10 s
- Establish high rate checkout beam for 1 hour
- Normalized rate should be the same as initial rate

### 2.6 Current Scan

- Bubble chamber active
- Establish $5.25 \mathrm{MeV}, 2 \mu \mathrm{~A}$ beam for 1 hour
- Normalized rate should be the same as initial rate
- Establish $5.25 \mathrm{MeV}, 1 \mu \mathrm{~A}$ beam for 2 hours
- Normalized yield should be the same as initial rate

## 3 Running

- Start with $5.25,5.15,5.05 \mathrm{MeV}$
- Spend shift on 4.75 MeV to see if signal can be identified
- If not revert to 5 point plan

### 3.1 6 Point Plan

| Shift | Energy | Current | Time |
| :--- | :---: | :---: | ---: |
| May 10 Swing | Commissioning | 8 |  |
| May 11 Swing | Commissioning |  | 16 |
| May 12 Day | 5.25 | 1.5 | 3 |
|  | 5.15 | 4.0 | 3 |
| May 12 Swing | 5.05 | 8.0 | 6 |
|  | 4.75 | 19.0 | $8+$ |
| May 13 Day | 4.95 | 19.0 | 16 |
| May 14 Owl | 4.85 | 50 | $48+$ |
| May 16 Day | 4.75 | 50 | 24 |

## 4 Run Statistical Objectives

| $T_{e}$ | $\bar{E}_{\gamma}$ | $I[\mu \mathrm{~A}]$ | $t[\mathrm{~h}]$ | Yield | Back | $\delta \sigma / \sigma[\%]$ | $\mathrm{Y}[/ \mathrm{hr}]$ |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 4.75 | 4.65 | 50.0 | 31.0 | 558.9 | 120.1 | 4.7 | 18.1 |
| 4.85 | 4.75 | 50.0 | 40.3 | 1517.9 | 135.1 | 9.5 | 37.7 |
| 4.95 | 4.85 | 19.3 | 12.7 | 730.4 | 46.3 | 5.6 | 57.7 |
| 5.05 | 4.95 | 8.0 | 5.8 | 682.0 | 19.2 | 5.2 | 118.3 |
| 5.15 | 5.05 | 3.4 | 3.0 | 708.8 | 8.2 | 5.0 | 233.6 |
| 5.25 | 5.15 | 0.6 | 3.0 | 762.5 | 3.2 | 4.5 | 256.8 |
| 95.7 |  |  |  |  |  |  |  |

or

| $T_{e}$ | $\bar{E}_{\gamma}$ | $I[\mu \mathrm{~A}]$ | $t[\mathrm{~h}]$ | Yield | Back | $\delta \sigma / \sigma[\%]$ | $\mathrm{Y}[/ \mathrm{hr}]$ |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 4.85 | 4.75 | 50.0 | 44.1 | 1659.8 | 166.2 | 2.6 | 37.6 |
| 4.95 | 4.85 | 28.1 | 26.4 | 2141.3 | 93.3 | 3.4 | 81.1 |
| 5.05 | 4.95 | 10.7 | 11.3 | 1687.5 | 35.5 | 3.3 | 149.9 |
| 5.15 | 5.05 | 3.9 | 6.9 | 1757.7 | 15.1 | 3.1 | 256.4 |
| 5.25 | 5.15 | 0.6 | 7.4 | 1891.9 | 6.0 | 2.9 | 256.9 |
|  |  | 96.0 |  |  |  |  |  |

## 5 Deconvolution, Relative Rates, and Uncertainties

The deconvolution matrix to reconstruct cross sections from normalized yields has for the first three terms

$$
\begin{equation*}
\sigma_{i} \propto \frac{Y_{i}}{L_{i} t_{i}}-1.25 \frac{Y_{i-1}}{L_{i-1} t_{i-1}}+0.125 \frac{Y_{i-2}}{L_{i-2} t_{i-2}} \tag{1}
\end{equation*}
$$

where $Y_{i}$ is the bubble yield for the $i$ th point, $L_{i}$ is the luminosity, and $t_{i}$ is the time spent. Terms without data are assumed to be zero, the lowest energy run has a poorly reconstructed cross section from a single yield, and the first two points are the most relevant.

| $T$ <br> $[\mathrm{MeV}]$ | $R$ <br> $\left[\mathrm{~s}^{-1}\right]$ | $R_{i} / R_{i-1}$ |
| :---: | :---: | :---: |
| 4.75 | $1.0 \times 10^{-3}$ |  |
| 4.85 | $2.2 \times 10^{-3}$ | 2.1 |
| 4.95 | $9.1 \times 10^{-3}$ | 4.1 |
| 5.05 | $5.0 \times 10^{-2}$ | 5.5 |
| 5.15 | $2.8 \times 10^{-1}$ | 5.7 |
| 5.25 | $1.9 \times 10^{-0}$ | 6.8 |

Table 1: Rate for $10 \mu \mathrm{~A}$

The approximate uncertainty for a point is

$$
\begin{align*}
\delta \sigma & \propto \sqrt{\frac{R_{i}}{L_{i} t_{i}}+\frac{3}{2} \frac{R_{i-1}}{L_{i-1} t_{i-1}}}  \tag{2}\\
\delta \sigma / \sigma & =\frac{\sqrt{R_{i} /\left(L_{i} t_{i}\right)+\frac{3}{2} R_{i-1} /\left(L_{i-1} t_{i-1}\right)}}{R_{i}-1.25 R_{i-1}} \tag{3}
\end{align*}
$$

For the lowest two energy points, the relationship from this formula is

$$
\begin{equation*}
\frac{\delta \sigma_{1}}{\sigma_{1}} \approx \frac{4}{3} \frac{\delta \sigma_{0}}{\sigma_{0}} \sqrt{2 \frac{L_{0} t_{0}}{L_{1} t_{1}}+\frac{3}{2}} \tag{4}
\end{equation*}
$$

Without background, the lowest point uncertainty $\delta \sigma_{1} / \sigma_{1}$ is limited to $1.6 \times \delta \sigma_{0} / \sigma_{0}$ in the situation where the integrated luminosity is infinite. This is a consequence of the fact that the relative rates for the lowest two points are only a factor of 2 different.
