DVCS with positrons and NPS (proposal to PAC48)

Physics goals and motivation:

- ✓ Precise determination of the absolute photon electro-production cross section
- ✓ Clean separation of DVCS² and DVCS-BH interference
- ✓ More stringer constraints on CFFs by combining
 e⁻ & e⁺ data
- Same experimental configuration as approved experiment E12-13-010 (exactly)
- Expected positron beam momentum spread comparable with current electron beam
- Positron beam emittance about a factor of 2 larger than current electron beam
- No additional systematic uncertainties expected due to the use of positrons

Same kinematics settings as approved E12—13-010 with electrons

Separation of DVCS² and BH-DVCS interference

Projections based on the KM15 model (Kumericki and Mueller, 2015)

Impact on Compton Form Factors (CFFs) extraction

- ✓ Combined fit of all electron data from approved experiment E12-13-010 (helicity-dependent AND helicity-independent cross sections)
- Fits include LO & LT CFFs, but also +1 helicity-flip CFFs ("HT") and +2 helicity-flip CFFs ("NLO")

k = 6.6 GeV Q² = 3 GeV

Cross sections generated with CFFs values fitted to 6 GeV data

Fits and analysis by M. Mazouz (U. of Monastir)

DVCS with positrons and NPS (proposal to PAC48)

A factor or 4-6 improvement in the extraction of LO/LT CFFs Re(H) and Re(H)

(factor of ~2 for HT and NLO)

Correlation coefficients (t=-0.26 GeV²)

Correlations between different CFFs are significantly improved by a combined fit with positrons

$$|\rho_{i,j}| = \left| \operatorname{cov}[\mathbb{F}_i, \mathbb{F}_j] / (\sigma_i \sigma_j) \right|$$

Much better separation of H & Ht CFFs at LT/LO

Summary and timeline

- > Positrons will help to cleanly separate DVCS2 and BH-DVCS interference
- > Strong impact on CFFs fits and extraction

- Proposal draft available <u>here</u>
 (an updated version will be circulated next week by email)
- > PAC deadline: June 22
