

Radiation hardness measurements of PbWO₄ crystals at IPN-Orsay

Ho San KO

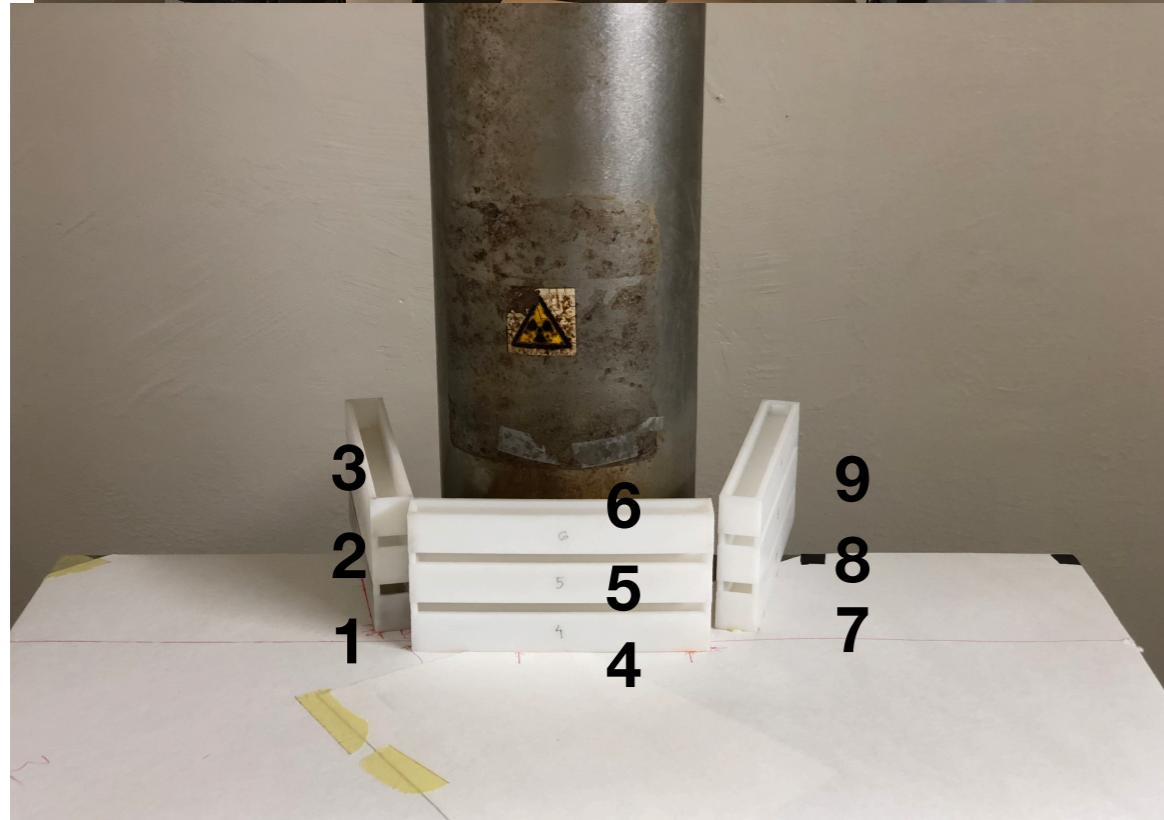

PHEN Institut de Physique Nucléaire d'Orsay

31. May. 2018

Outline

- Orsay irradiation Facility
 - Fricke dosimetry to measure the gamma dose and dose rate
 - PbWO₄ Irradiation
- PbWO₄ transmittance and dK results comparisons with Giessen's

Irradiation Facility

- Co60 source, 222TBq
- With simple mechanical design, the distance from the source can be reproduced.
- With this setup, we can irradiate 9 crystals/water at the same time.
- Bottom figure is to irradiate with higher dose rate.
(15cm from the source)
- Results to be shown today were irradiated 60cm from the source

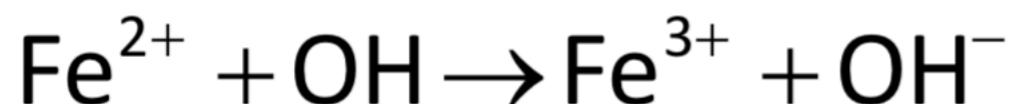

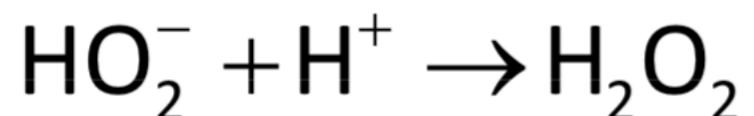

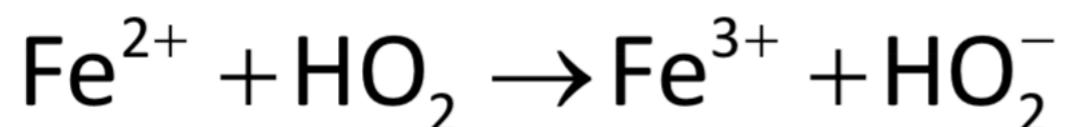

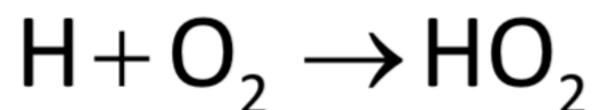

Irradiation Facility

- To estimate the dose and dose rate in crystals
 - We irradiated water(Fricke solution) with the same positions(distance from the gamma source) and the same shape and volume of those of the crystals.

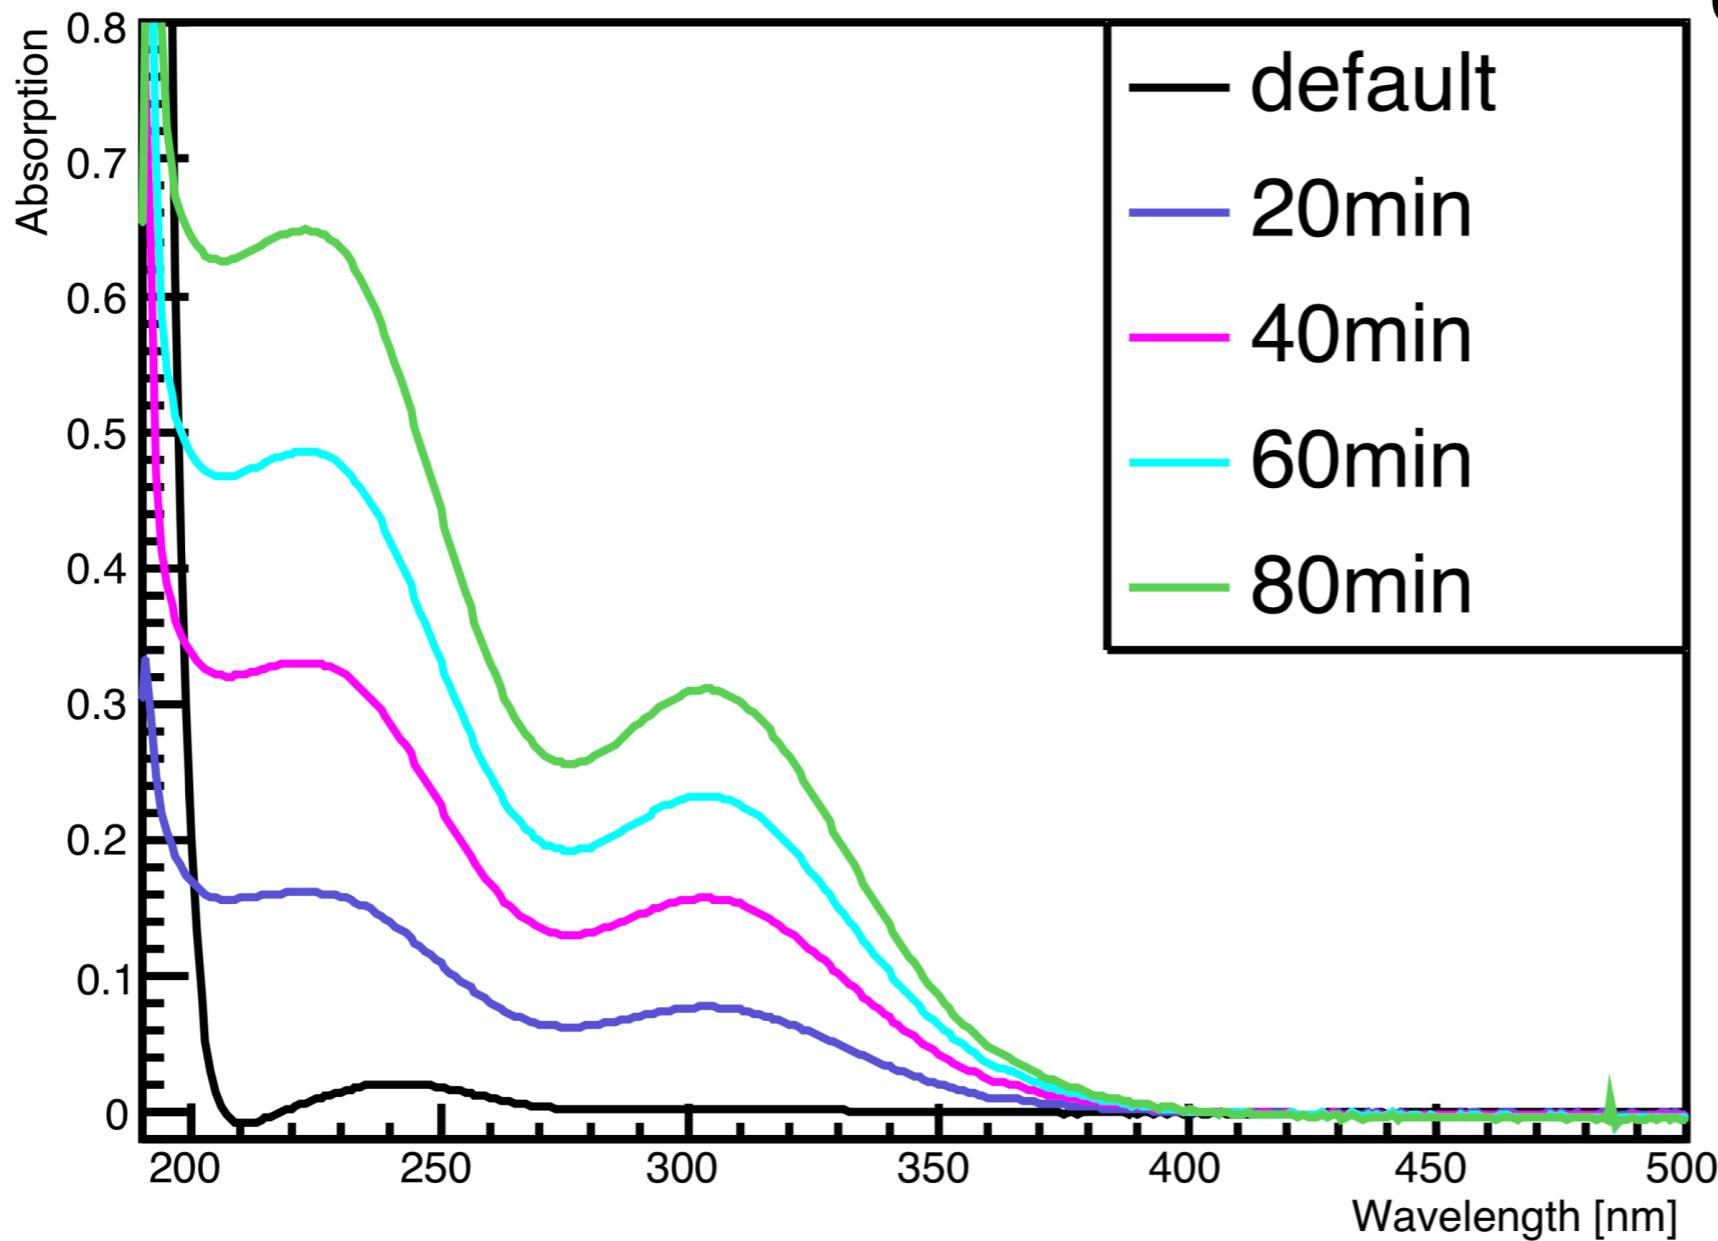

- Fricke dosimetry is well studied. It changes the light absorption linearly by the irradiation at certain wavelength until certain amount of dose(~200Gy).

Fricke solution

- Solution of Fe²⁺
- Gamma irradiates water -> Ferrous ions(Fe²⁺) to Ferric ions(Fe³⁺)
- Fe³⁺ absorbs light.
Peak at 304nm

Water Irradiation Results

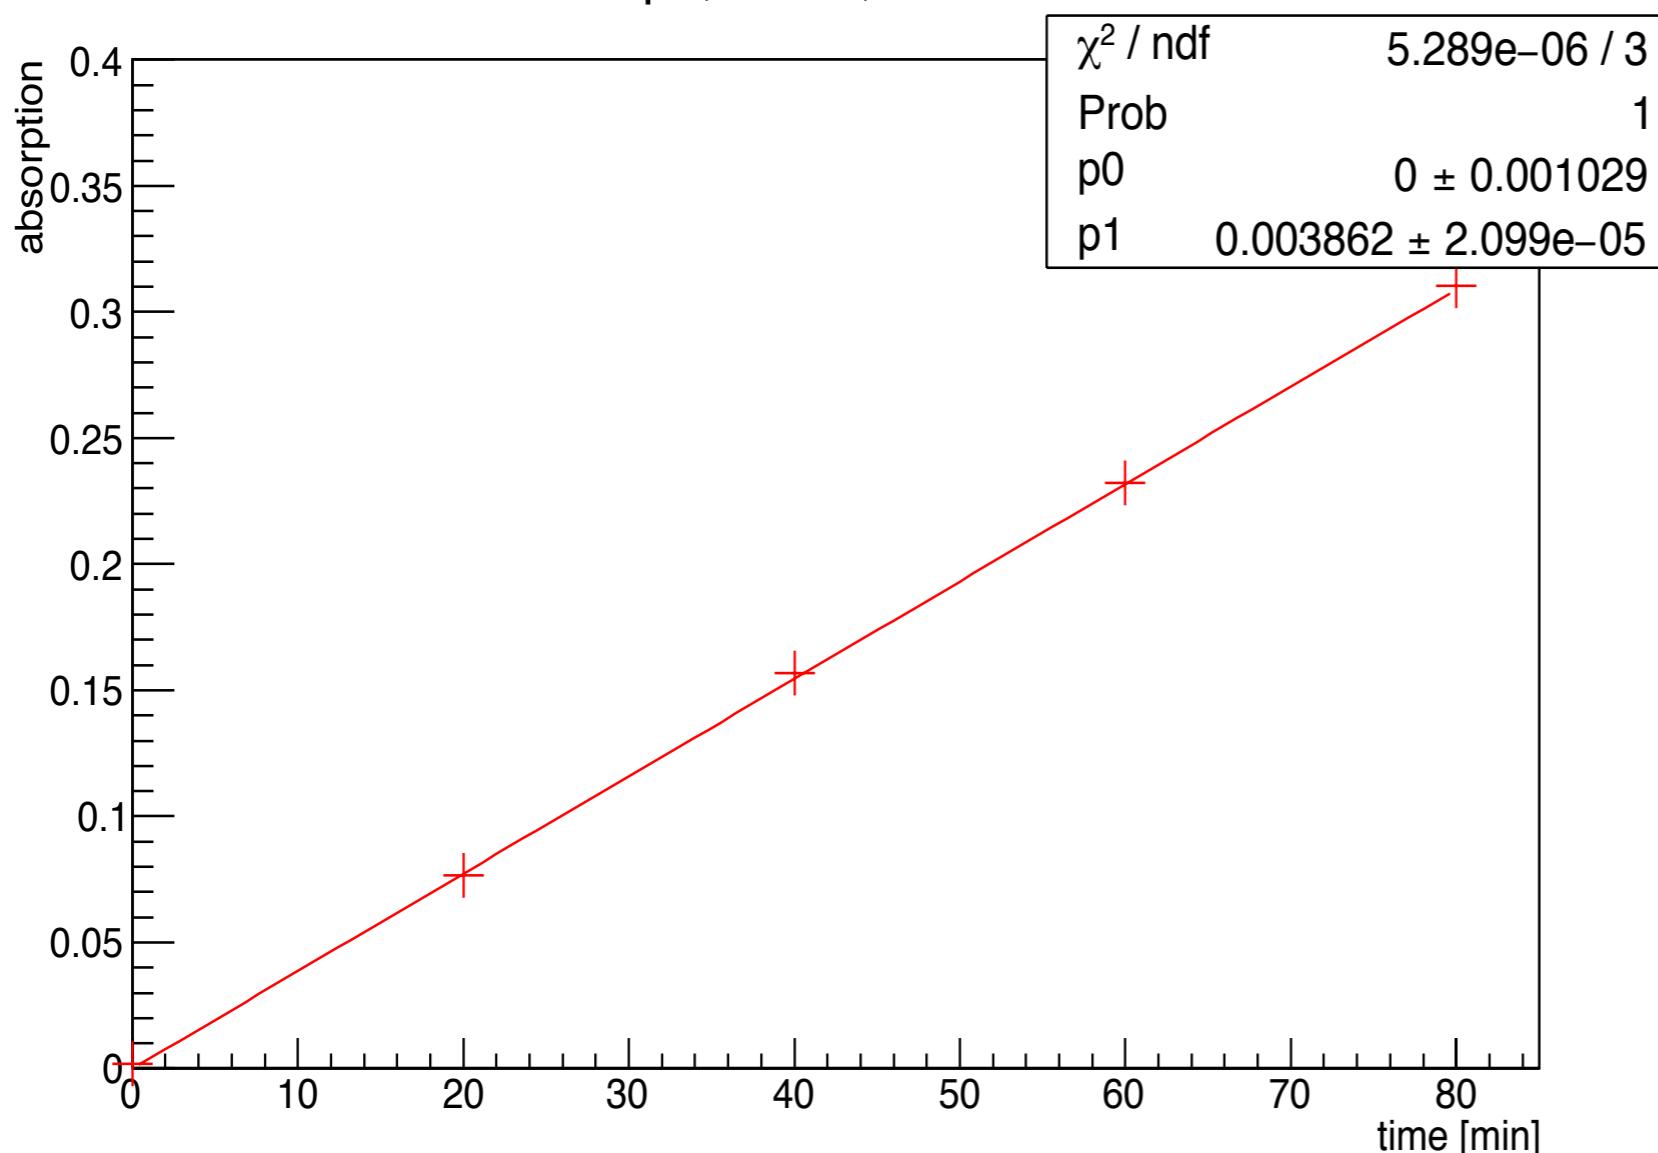

60cm away from the source

- ▶ Light absorption increases with respect to the dose.
- ▶ Get the peak values at 304nm to get the absorption change rate

Water Irradiation Results

- Absorbance changes throughout irradiation.

- Increase of light absorption throughout irradiation time
- With the absorption change rate, we can get the dose rate.

60cm away from the source

Water Irradiation Results

- Dose rate calculation from solution's absorbance

$$\text{Absorbance } (A) = \log \frac{I_0}{I} = \varepsilon \times l \times C = \varepsilon \times l \times G \times \rho \times D(t)$$

$$\text{Dose rate}(Gy/min) = \frac{\Delta A(cm^{-1})}{\varepsilon(L\ mol^{-1}) \times G(mol\ J^{-1}) \times \rho(kg\ L^{-1})} \times \frac{1}{\Delta t(min)}$$

I : measured light intensity through the material

ε : molar extinction coefficient. $2160 + 15(T - 25)$ at 304nm

l : optical path

C : number of moles transformed by the irradiation

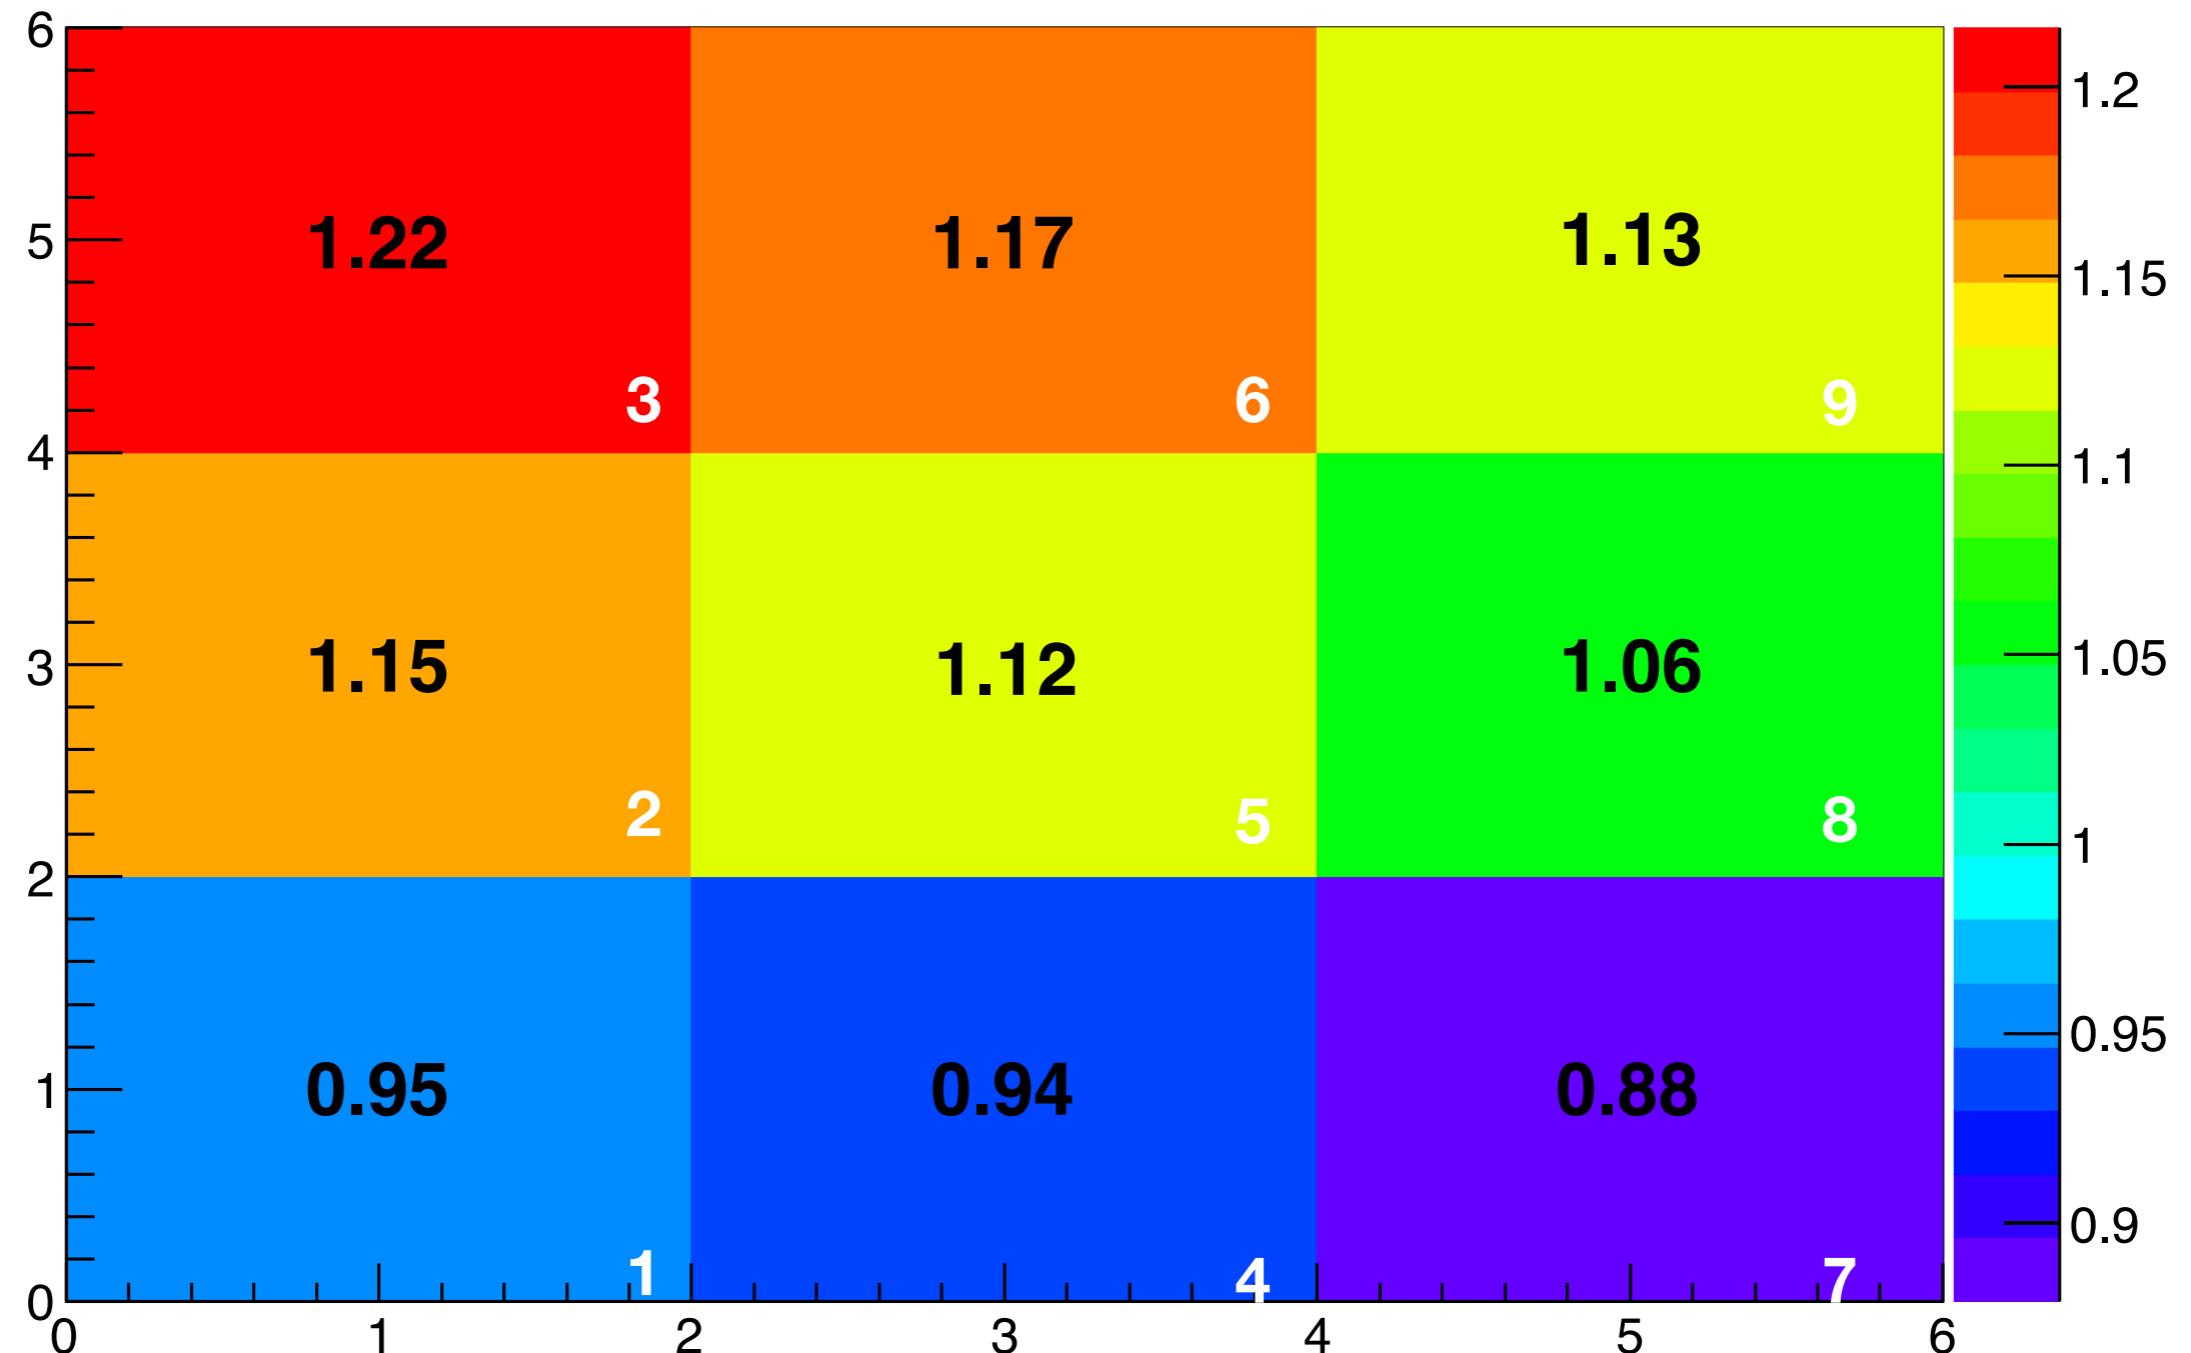

G : efficiency for appearance of Fe³⁺ 1.62×10^{-7} mole/J

ρ : mass density of the solution

$D(t)$: radiation dose

Water Irradiation Results

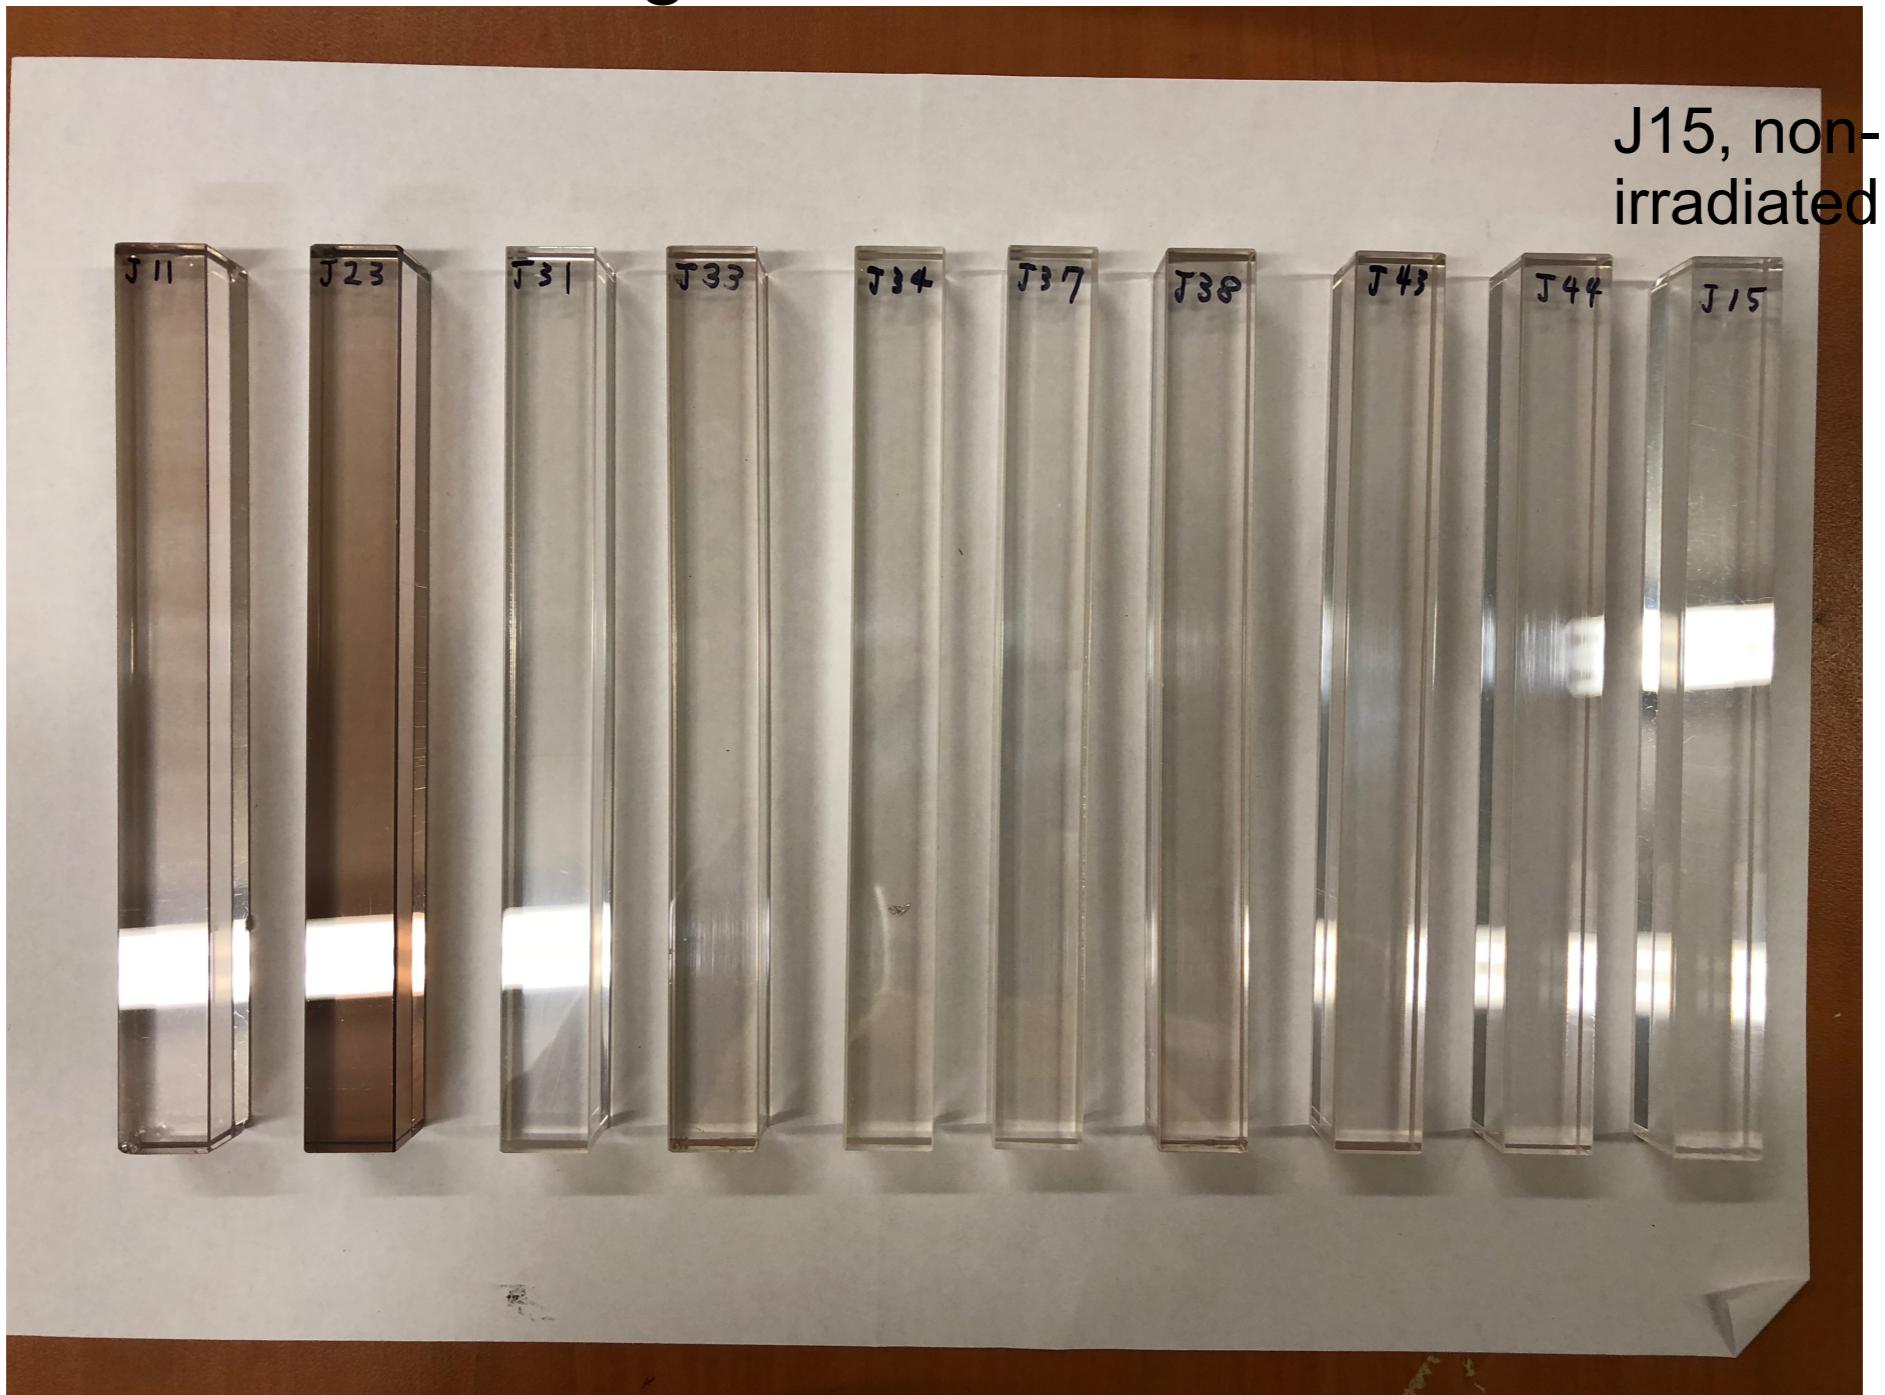

Dose rate. 60cm away from the source

- Dose rate average of 1.11Gy/min (Giessen's : 1.16Gy/min)

PbWO₄ Irradiation Results

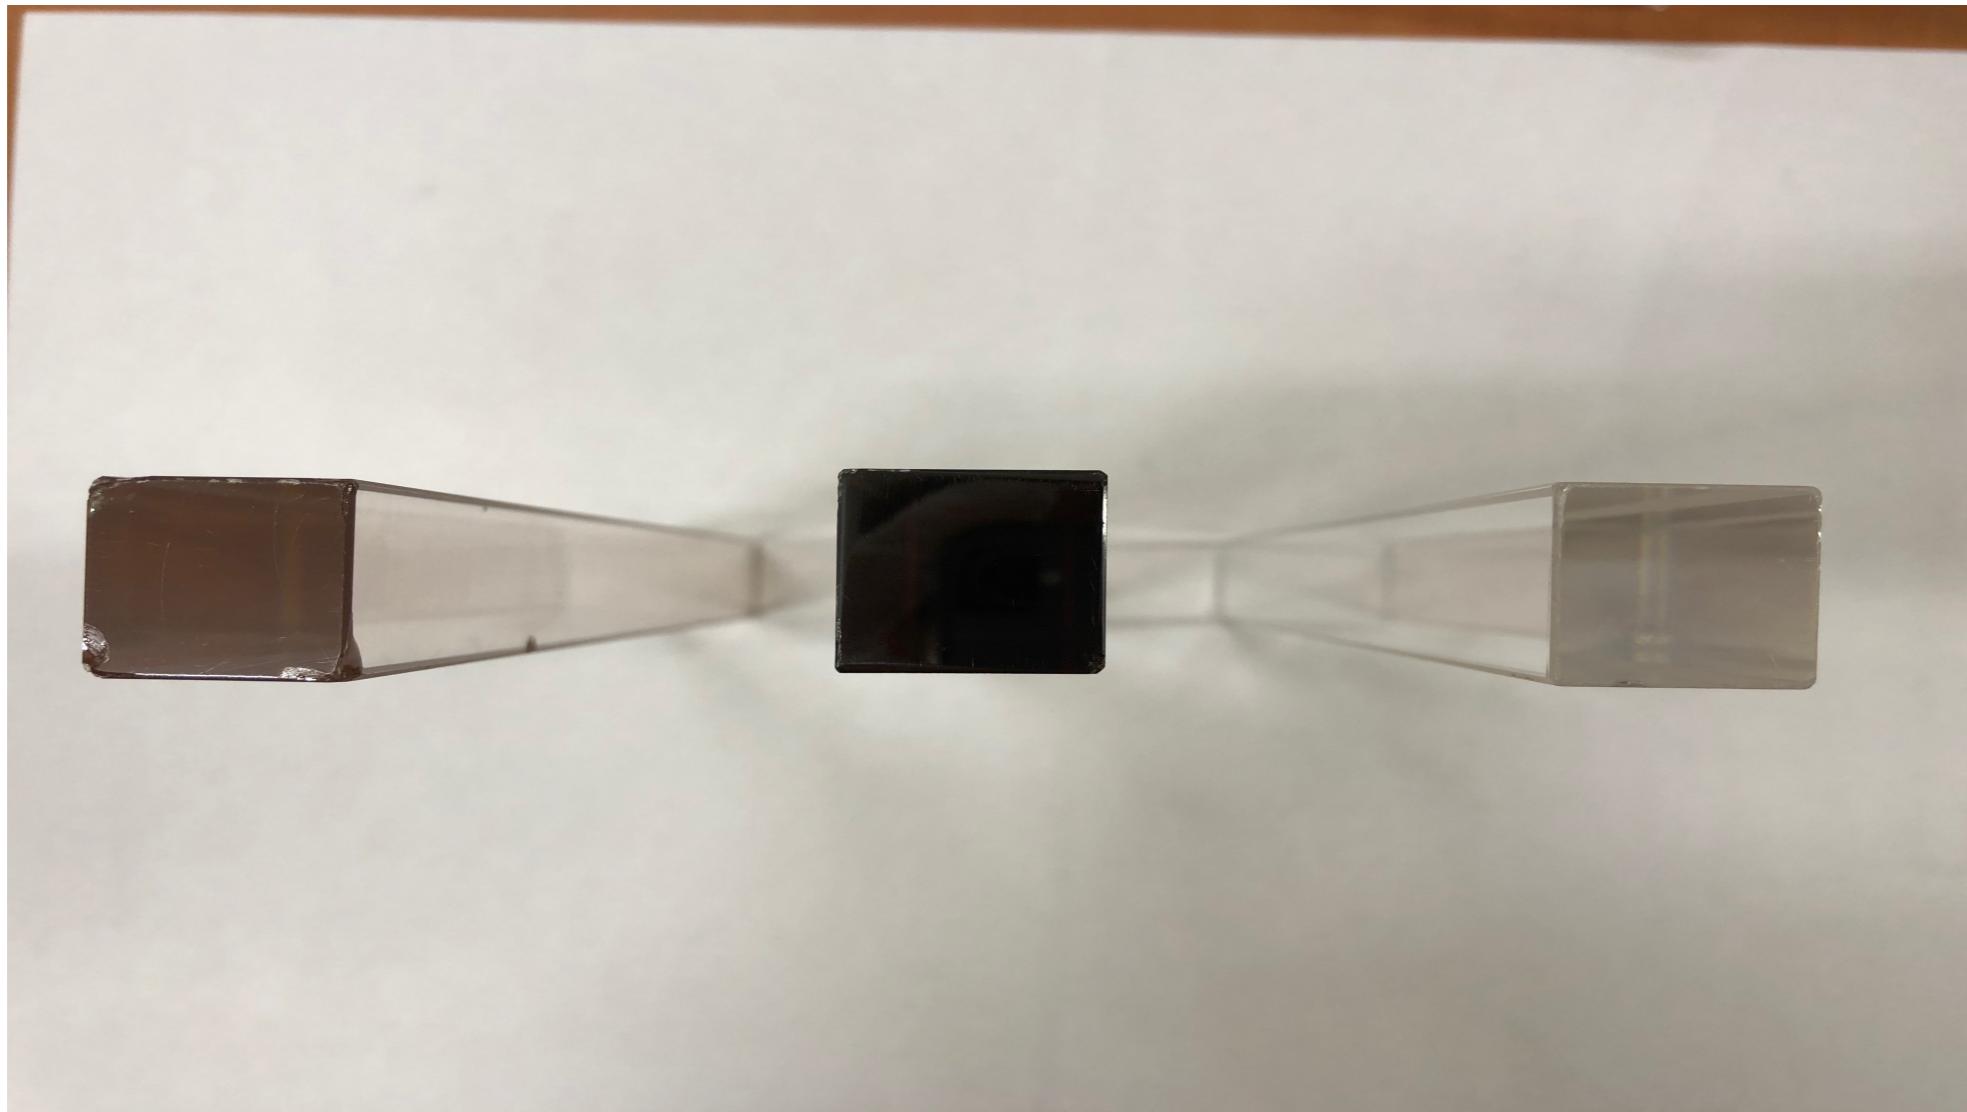

- Crystals' color changes after irradiation.

- The picture was taken after higher dose rate(>17Gy/min)

PbWO₄ Irradiation Results

- Crystals' color changes after irradiation.

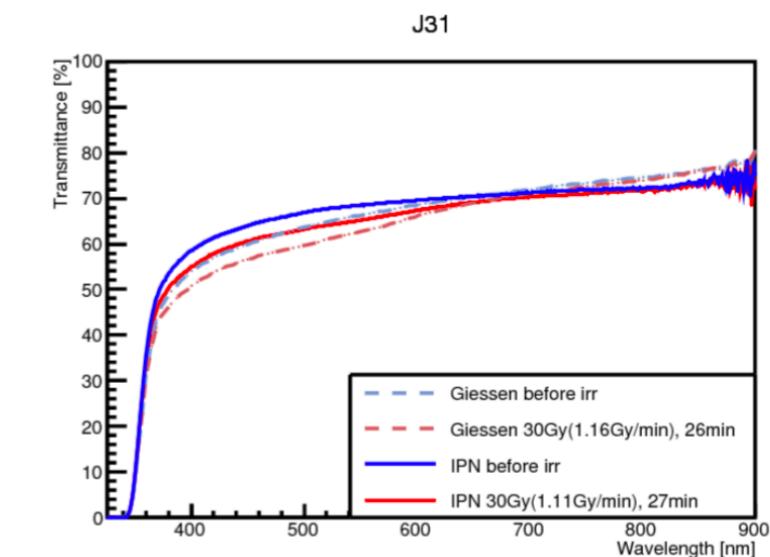

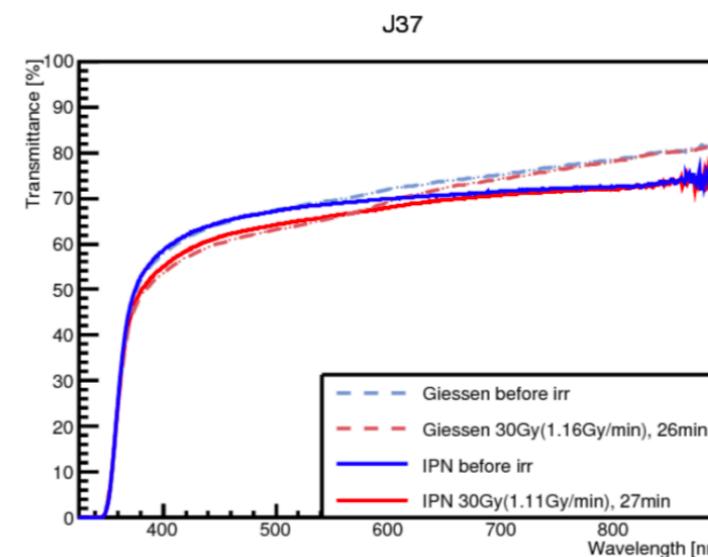

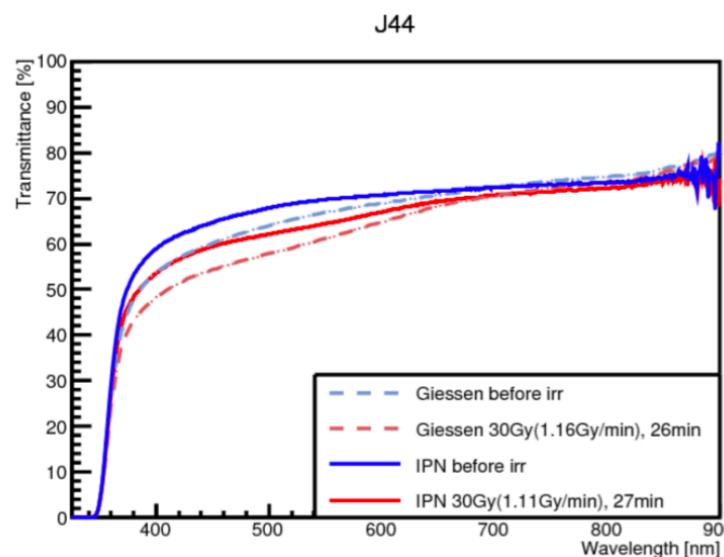

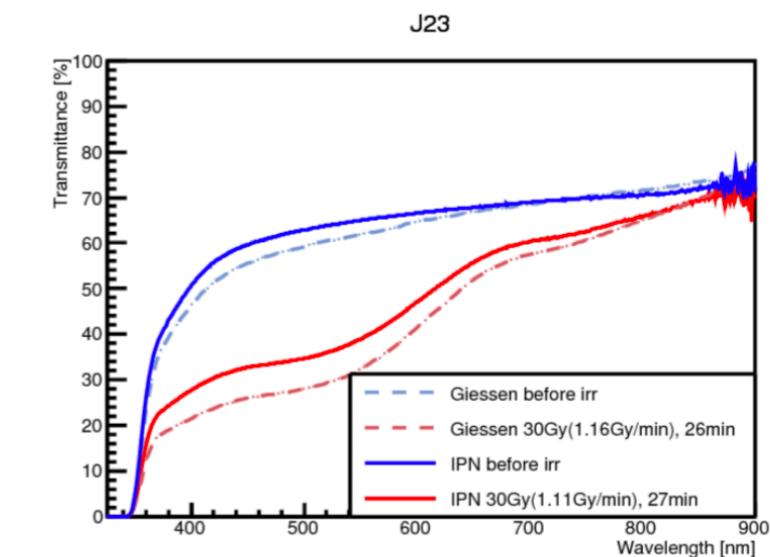

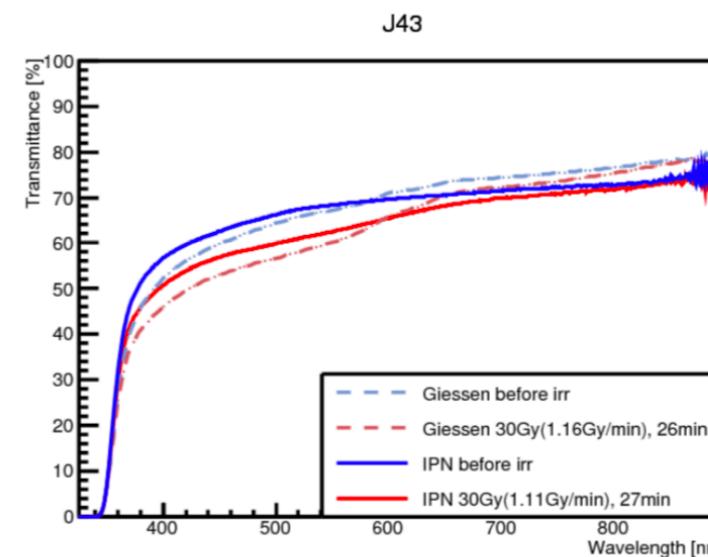

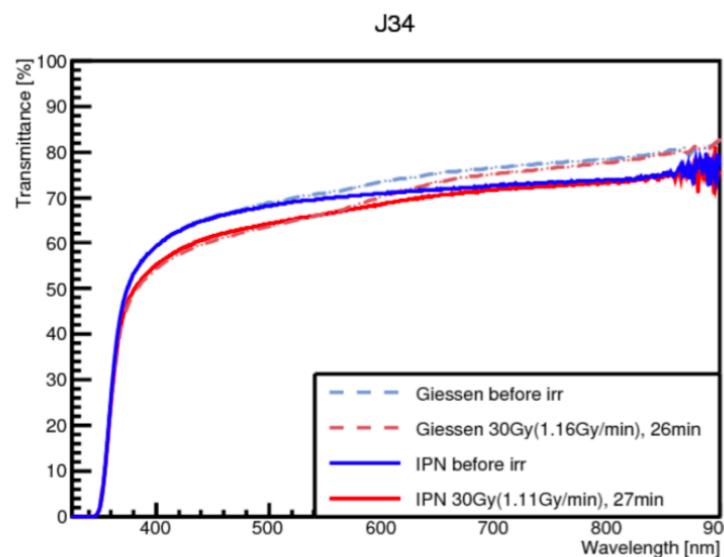

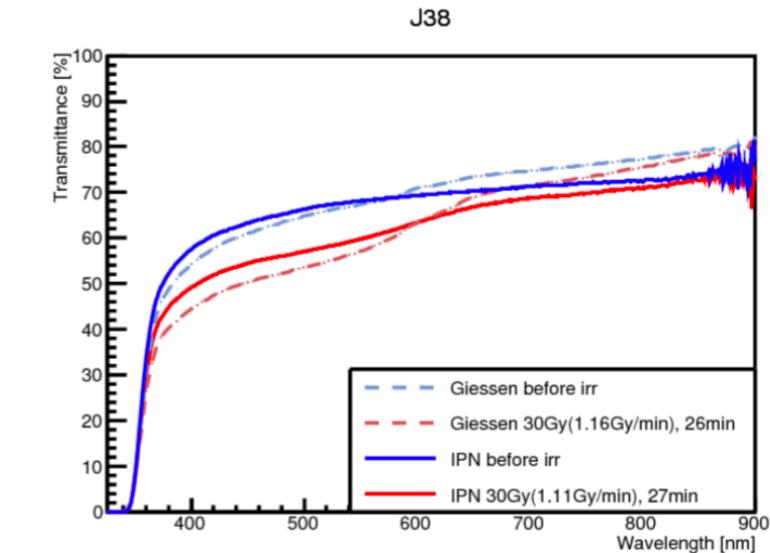

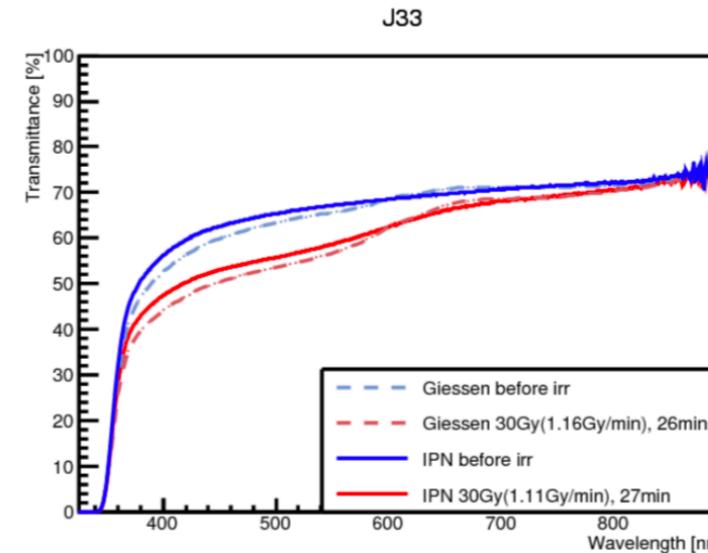

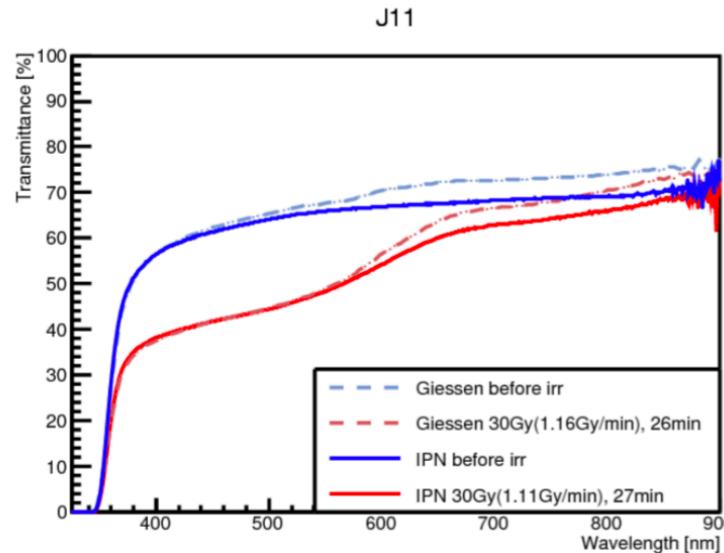

J11

J23, damaged the most

J15, non-irradiated

- The picture was taken after higher dose rate(>17Gy/min)

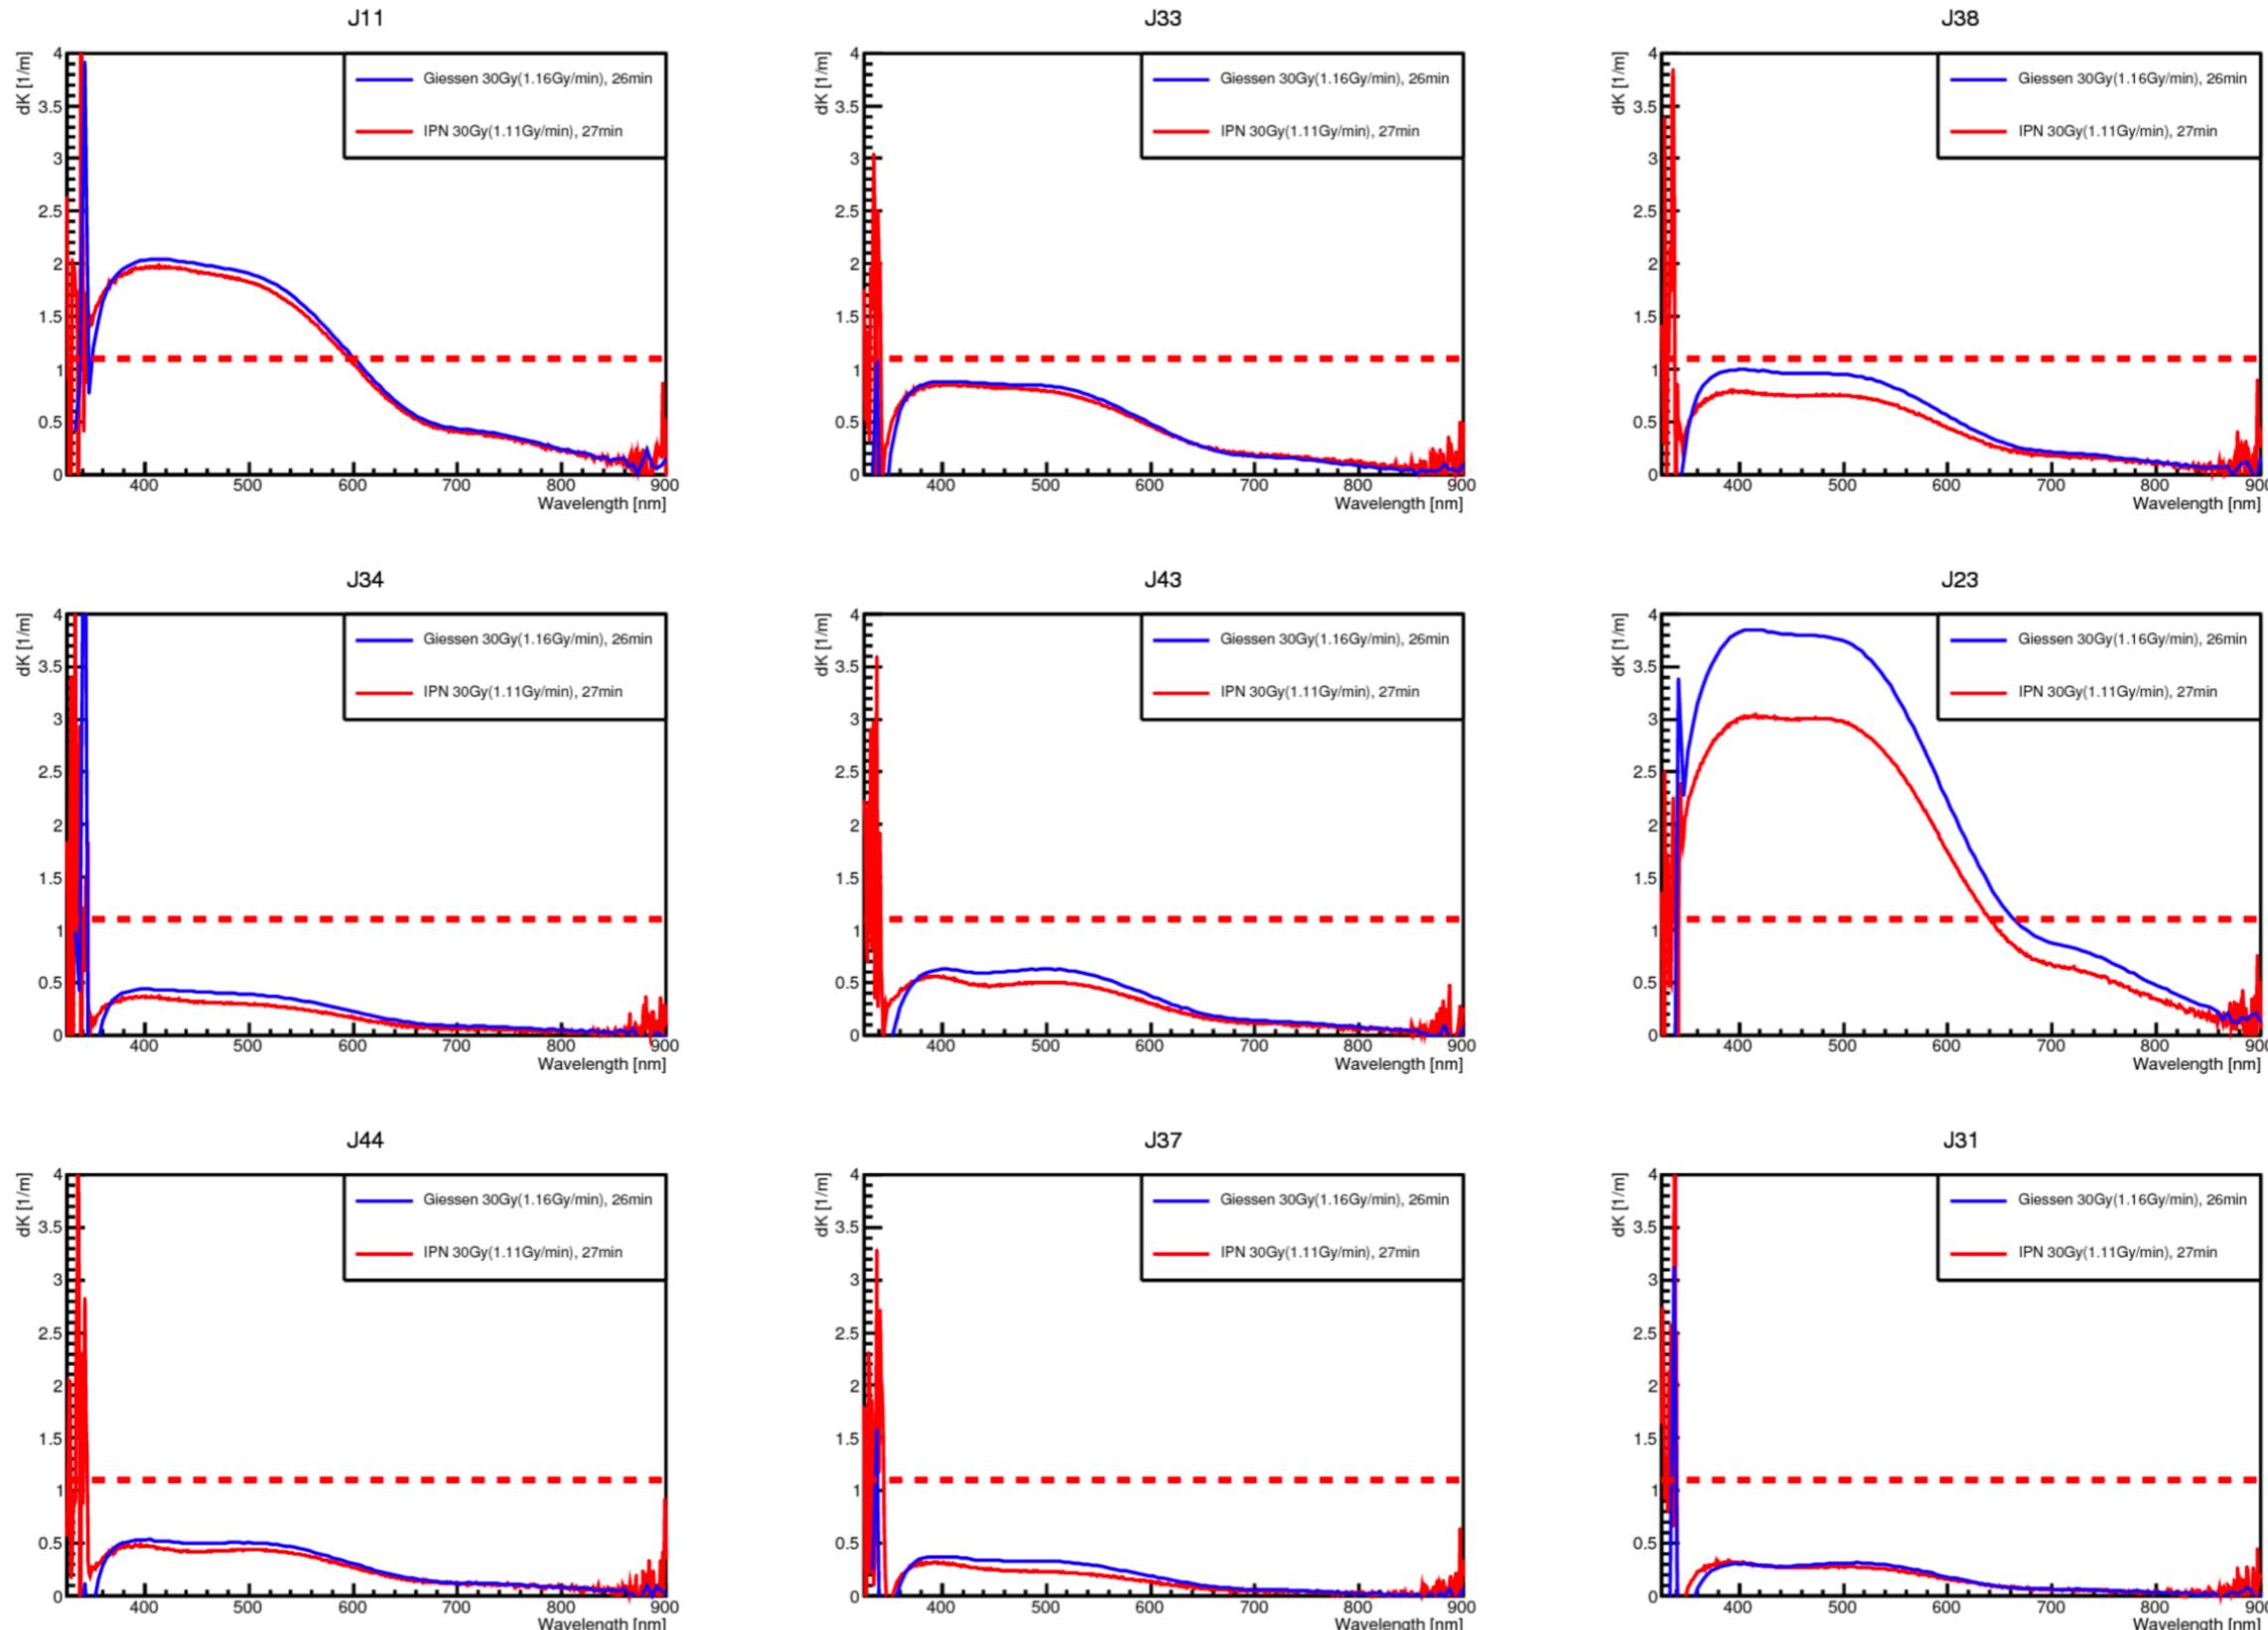

PbWO₄ Irradiation Results

PbWO₄ Irradiation Results

- Delta K $dk = \ln(T_b/T_a)/l$

dK limit used for PANDA : 1.1/m

Summary

- Using water irradiation, we can measure the dose rate.
- IPN's & Giessens' transmittance & dK results are in very good agreement.
- Upcoming curing system test

Backups

IPN Radiation Facility
