# Compton polarimetry for EIC

EIC users meeting 2018 at CUA Detectors, Computing, and New Technologies Alexandre Camsonne July 31<sup>st</sup> 2018

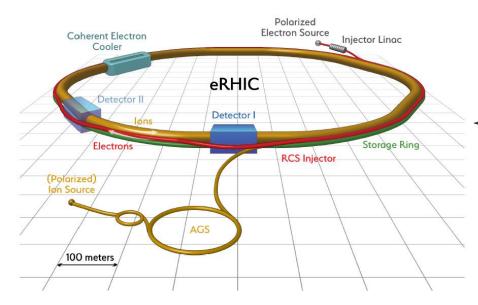

# eRHIC

5

#### pCDR eRHIC Design Concept

#### ♦ Hadron Beam

- ♦ entirely re-uses injection chain and one of RHIC rings (Yellow ring)

#### Electron Accelerator added inside the existing RHIC tunnel:

- $\diamond$  5-18 GeV Storage Ring
- ♦ On-energy injector: 18 GeV Rapid Cycling Synchrotron
- ♦ Polarized electron source and 400 MeV injector linac: 10nC, 1 Hz

#### ♦ Hadron cooling system

required for L=  $10^{34}$ cm<sup>-2</sup>s<sup>-1</sup> Without cooling the peak luminosity reaches 4.4  $10^{33}$ cm<sup>-2</sup>s<sup>-1</sup>

#### eRHIC beam parameters

#### Beam Parameters for 275(p)x10(e) GeV

	Nominal Design (with cooling)		Risk Mitigation (no cooling)	
Species	р	e	р	E
Bunch frequency [MHz]	11	2.6	56.3	
Bunch intensity [10^11]	0.6	1.5	1.05	3.0
Number of bunches	13	20	660	
Beam current [A]	1	2.5	0.87	2.5
Rms norm. emit. h/v [um]	2.7/0.38	391/20	4.1/2.5	391/95
Rms emittance h/v [nm]	9.2/1.3	20/1	13.9/8.5	20/4.9
β* h/v [cm]	90/4	42/5	90/5.9	<mark>63/10.4</mark>
IP rms beam size h/v [um]	91/7.2		112/22.5	
IR rms angular spread h/v [urad]	101/179	219/143	124/380	179/216
b-b parameter (/IP) h/v	0.013/0.007	0.064/0.099	0.015/0.005	0.1/0.083
Rms bunch length [cm]	5	1.9	7	1.9
Rms energy spread, 10^-4	4.6	5.5	6.6	5.5
Max space charge parameter	0.004	neglig.	0.001	neglig.
IBS growth time tr/long, h	2.1/2.0		9.2/10.1	
Polarization, %	80	70	80	70
Hourglass and crab crossing factor	0.87		0.85	
Peak luminosity [10^33 cm-2s-1]	10.1		4.4	
Integrated luminosity/week, fb <sup>-1</sup>	4.51		1.12	

Hadron cooling provides ~factor 4 integrated luminosity increase at  $E_{CM}$ =105 GeV. But larger increase, by factor 7-10, is expected in low range of  $E_{CM}$  (29-70 GeV).

#### JLEIC Layout: A Ring-Ring Collider

🔞 💎

JULICI JULI LaD

#### JLEIC *e-p* Parameters (pre-CDR)

CM energy	GeV	21.9 (low)		44.7 (medium)		63.3 (high)	
		р	е	р	е	р	е
Beam energy	GeV	40	3	100	5	100	10
Collision frequency	MHz	4	76	476		476	
Particles per bunch	10 <sup>10</sup>	0.98	3.7	0.98	3.7	0.98	0.93
Beam current	А	0.75	2.8	0.75	2.8	0.75	0.71
Polarization	%	80	80	80	80	80	75
Bunch length, RMS	cm	3	1	1	1	1	1
Norm. emitt., horiz./vert.	μm	0.3/0.3	24/24	0.5/0.1	54/10.8	0.9/0.18	432/86.4
Horizontal & vertical β*	cm	8/8	13.5/13.5	6/1.2	5.1/1	10.5/2.1	4/0.8
Vert. beam-beam param.		0.015	0.092	0.015	0.068	0.002	0.009
Laslett tune-shift		0.06	7x10 <sup>-4</sup>	0.055	6x10 <sup>-4</sup>	0.03	7x10 <sup>-5</sup>
Detector space, up/down	m	3.6/7	3.2/3	3.6/7	3.2/3	3.6/7	3.2/3
Hourglass(HG) reduction		1		0.87		0.	86
Luminosity/IP, w/HG, 1033	cm <sup>-2</sup> s <sup>-1</sup>	2	2.5	21.4		1	.7

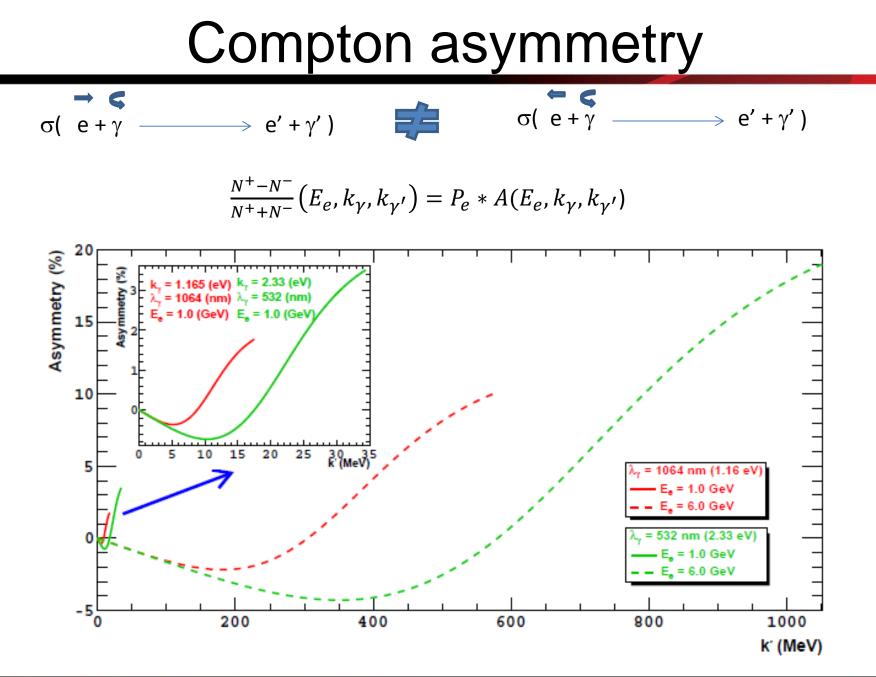

Similar high performance can be achieved for electron-ion (e-A) collisions 5

#### eRD15 : Compton electron detector R&D

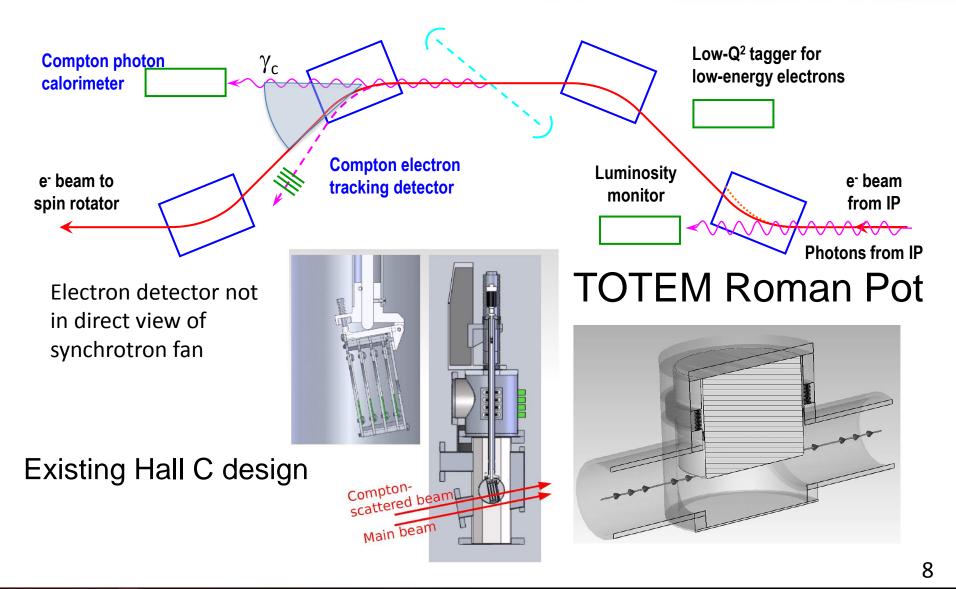

- Requirement
  - 1% electron polarization measurement
  - Best measurement Compton electron detector at SLD (~0.5%)
- Deliverables
  - Simulation to determine signal to background for JLEIC baseline Roman Pot and expected accuracy

#### Compton electron detector

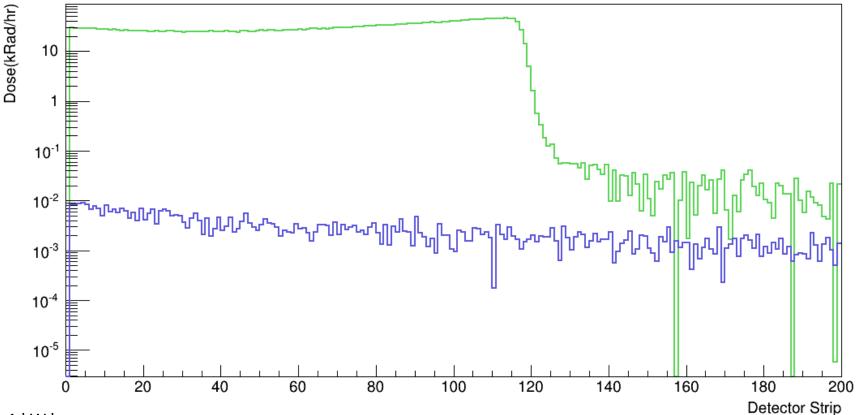

### **Radition hardness**

**Composite Detector Dose** 

#### 1 A 1 kW laser power

Consistent with estimation from a previous experiment in Hall C which showed no damages for the diamond detector after 10 Mrad ( 3 hours at JLEIC ), regular silicon looses 50 % of amplitude after 10 Mrad Operate diamond detector at low duty cycle (1s/10 min) and lower laser power (10 W) to extend lifetime up to 3 years

Radiation hard detector allows continuous monitoring of the polarization

#### Compton polarimeter electron detector

#### Detector options (rough properties)

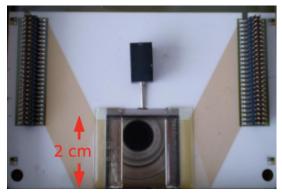

Detector	Si	LGAD	Diamond	MAPS
Thickness	200 um	50 to 30 um	500 um	50 to 30 um
Neutron fluence	3.10^15	3.10^16	10^16	>5.10^14
Dose Mrad	3	30	100	1
Timing resolution	50 ns	30 ps	80 ps	<16 ns
Costs	\$	\$	\$\$\$	\$

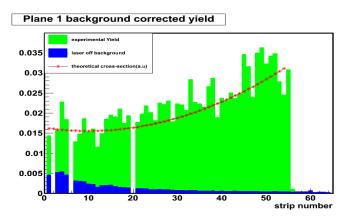

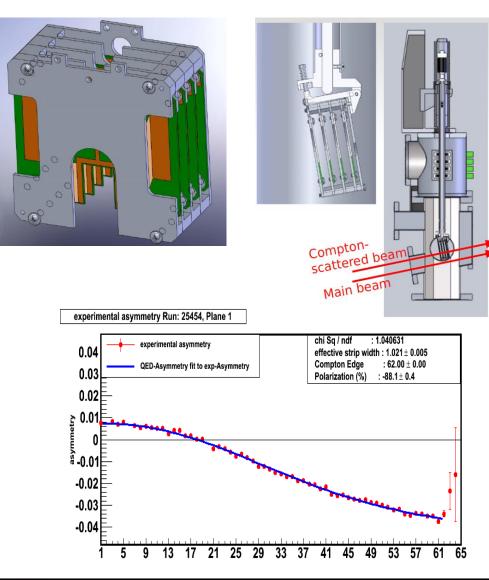

#### Compton polarimeter electron detector

- Silicon or diamond strip option
- About 200 to 250 strips
  250 μm width
- 5 cm length to catch zero crossing

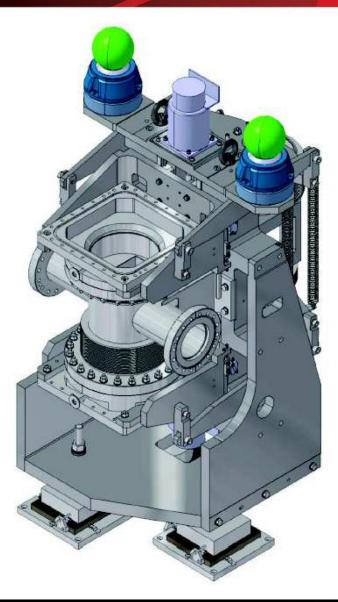

# Roman pots from TOTEM

- For small angle detection
- Two chambers
- Thin window
- Can be moved in and out from beam
- Typical 10 to 15 sigma
- Up to 4-5 sigma in optimal places
- Might work for electron side at both JLEIC and eRHIC to be studied

### Measurement times for 1% statistics

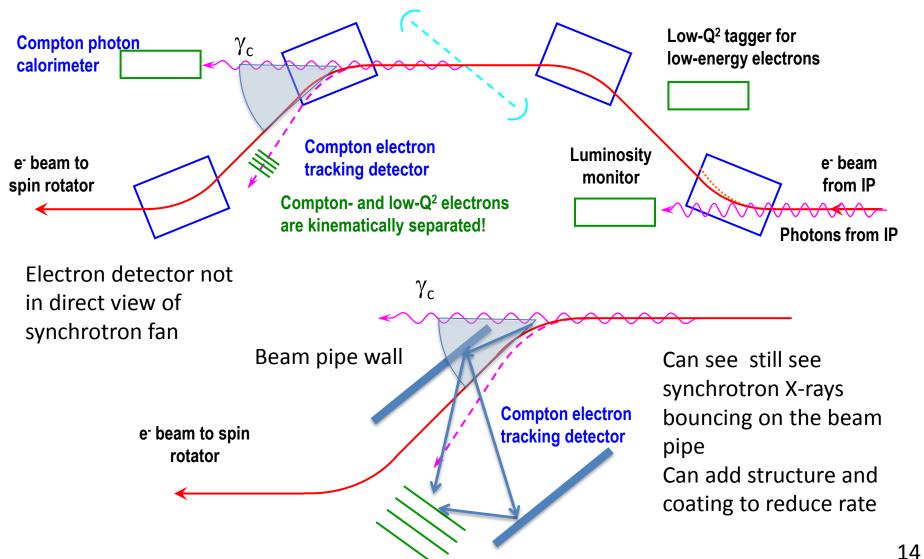

Energy	Current	1 pass laser (10 W)		FP cavity ( 1kW)	
(GeV)	(A)	Rate (MHz)	Time for 1% uncertainty (ms)	Rate (MHz)	Time for 1% uncertainty (ms)
3	3	26.8	161	310	14
5	3	16.4	106	188	9
10	0.72	1.8	312	21	27

Typical measurement takes less than 1 second even at 10 Watts of laser power

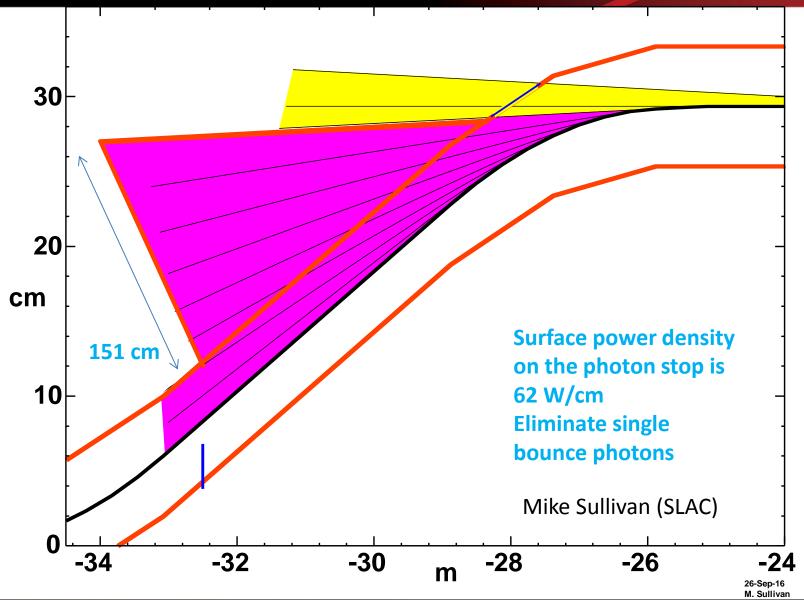

#### Synchrotron radiation

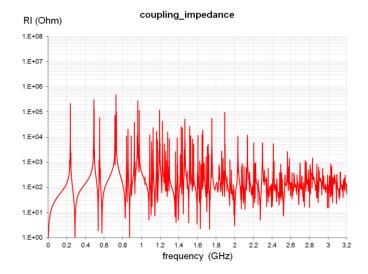

#### Ante-chamber method

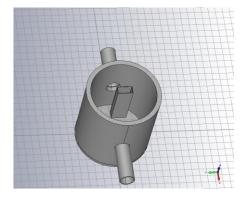

15

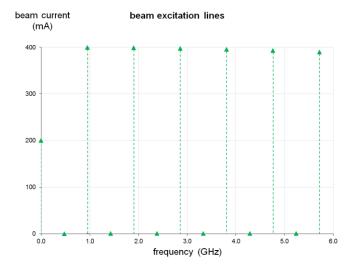

# Wakefield (EIC RP)

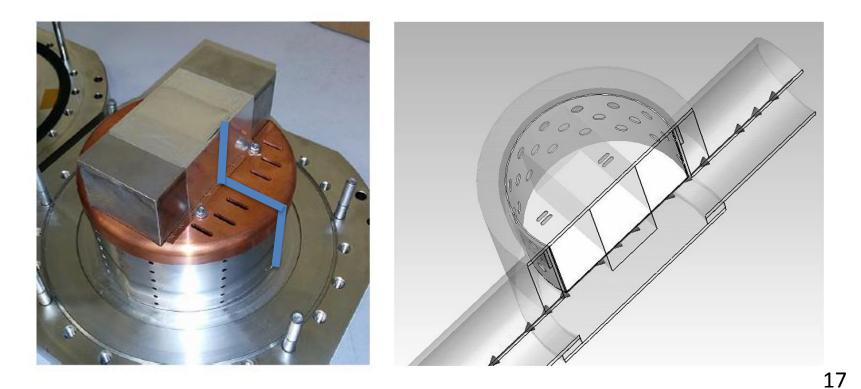

- Impedance evaluation interrupted after 37 hours of computation
- Estimate power deposit
  - 340 W for 0.4 A
  - 2.55 kW for 3 A
- Possible with liquid cooling

#### Wakefield (EIC RP)

TOTEM design

# Deliverable estimate for FY 2019

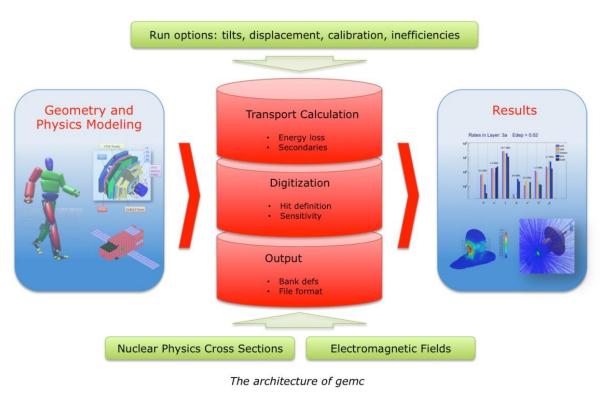

#### Simulation

- Implement beam pipe in magnet
- More cross check with old simulation
- Full simulation with Interaction Region and beam pipe
- Run simulation large scale on batch farm will full setup
- Halo modelling
- Model beam laser interaction
- Implement polarization extraction analysis
- Study of systematics and optimization of the setup
- Realistic Roman Pot Geometry
- Synchrotron radiation study, detector response to synchrotron photons

### **GEMC** framework at JLab

GEMC: Application built on GEANT4. Used to simulate particles through matter.

Intended to make simulations available without the requirement of GEANT4 or C++ knowledge.

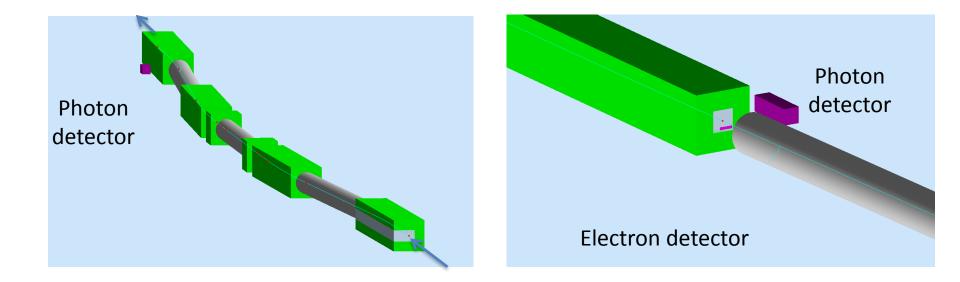

Allows for real-time changes in experimental parameters without the need to recompile

<u>GEant Monte Carlo</u> (GEMC) is the primary simulation framework for the JLEIC detector design including the Compton polarimetry R&D effort.

Detector and beamline geometries added via simple perl API.

### **Beamline Geometry in GEMC**

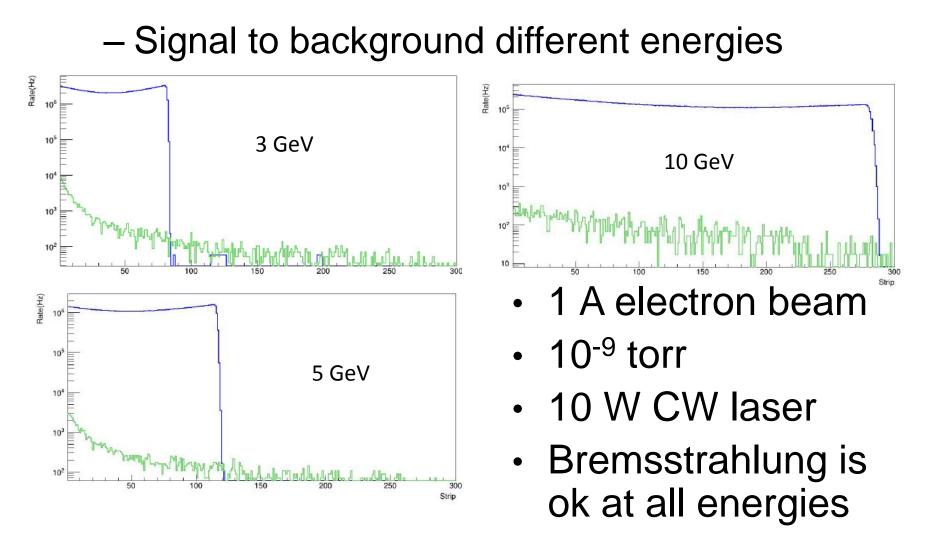

- Beam pipe implemented
- All presentation simulation results only done with the chicane to speed up the studies

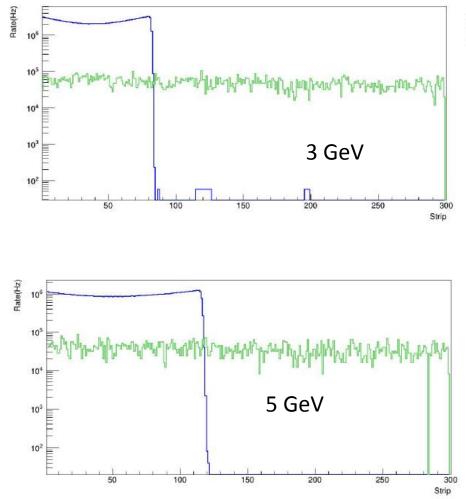

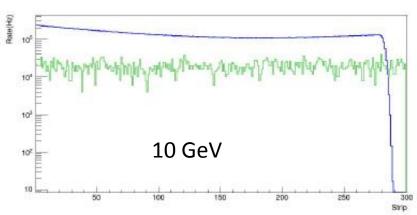

#### Simulation results

### Halo contribution for apertures

- 1 cm aperture
- S/B still around 10
- 10 W CW laser no need for aperture unless need more power with cavity

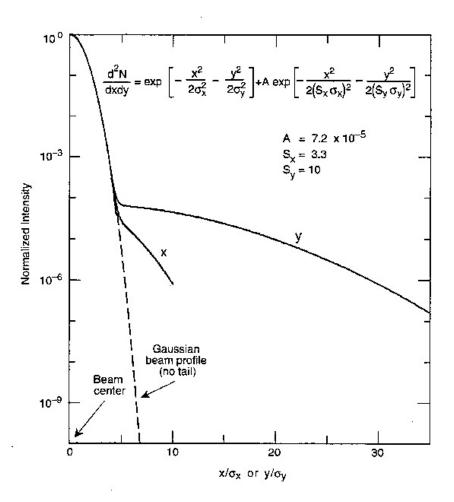

#### Beam halo modelling

Both GEANT3 and GEANT4 simulations uses description of beam halo from PEPII design report[1].

Halo flux is about 0.25% of total beam flux

Backgrounds due to halo can contribute in two locations

Interactions with cavity apertures Direct strike of electron detector

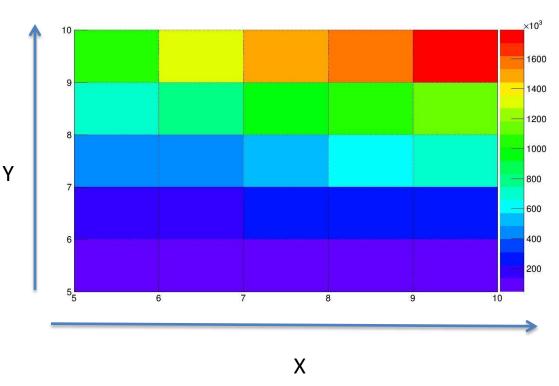

### Halo induced background

Halo contributions from the IP due to apertures, were studies over both energies.

Rates are at an acceptable level and easily controllable be varying the aperture size. The more pertinent problem is halo interacting with the detector directly.

Halo in the detector is a potential problem if the width is not controlled (worst case 1.6 MHz). More accurate estimations of potential values are possible once we are provided with estimated beam properties

Detector rate for different combinations of the halo Multipliers. Rates are for halo at the detector.

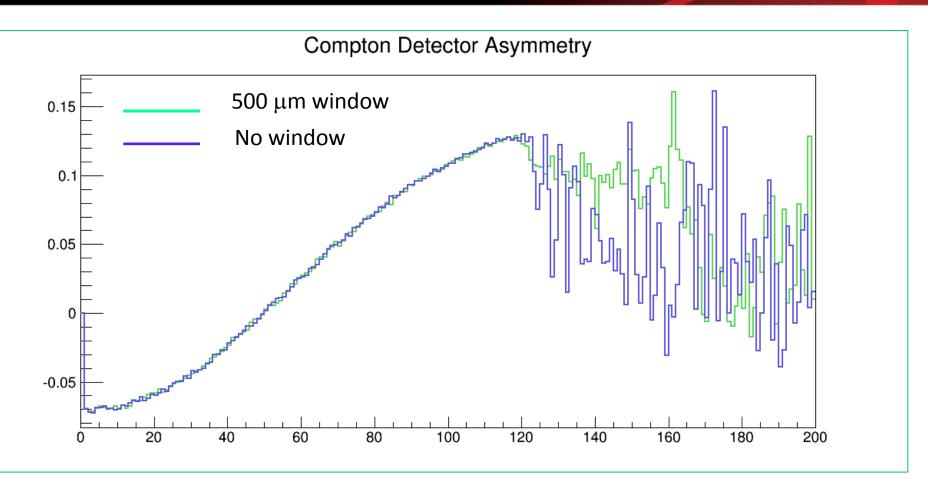

#### Strip size optimization

0.1.01	E (CIV)	D.L	2 / 1000
Strip Size	Energy $(GeV)$	Polarization	$\chi^2/\mathrm{NDF}$
$240 \ \mu m$	3	$-97.02 \pm 0.67$	1.02
$480 \ \mu m$	3	$-97.97\pm0.64$	1.09
$1200 \ \mu m$	3	$-97.43 \pm 0.65$	2.29
$2400 \ \mu m$	3	$-96.01 \pm 0.62$	4.83
$-2880\ \mu m$	3	$-95.25 \pm 0.60$	6.01
$4800 \ \mu m$	3	$-96.20 \pm 0.64$	7.45
$240 \ \mu m$	5	$-97.69\pm0.58$	0.88
$480 \ \mu m$	5	$-97.48\pm0.58$	0.83
$1200 \ \mu m$	5	$-97.53 \pm 0.59$	0.97
$2400 \ \mu m$	5	$-97.41 \pm 0.59$	1.02
$-2880~\mu m$	5	$-97.17 \pm 0.59$	1.23
$4800 \ \mu m$	5	$-96.68 \pm 0.60$	2.29
$240 \ \mu m$	10	$-97.19\pm0.24$	1.08
$480 \ \mu m$	10	$-97.94 \pm 0.23$	1.37
$1200 \ \mu m$	10	$-97.79 \pm 0.23$	1.36
$2400 \ \mu m$	10	$-97.70 \pm 0.23$	3.73
$-2880\ \mu m$	10	$-97.71 \pm 0.26$	4.31
$4800 \ \mu m$	10	$-97.65 \pm 0.23$	7.96

- strip size can
  be divided by 5
- 40 strips detectors sufficient for 1% accuracy
- small correction at 3 GeV

# Compton asymmetry with window

Higher statistics MC comparison

## Effect of RP window

Energy	Thickness	Polarization	Error
3	50	-97.02	+/-0.67
3	500	-96.60	+/-0.90
3	1000	-95.82	+/-0.81
5	50	-97.69	+/- 0.58
5	500	-96.59	+/- 0.79
5	1000	-96.68	+/- 0.50
10	50	-97.19	+/- 0.17
10	500	-97.19	+/- 0.24
10	1000	-97.02	+/- 0.20

- polarization correction at 3 and 5 GeV due to thickness
- consistent with input polarization of 97% within 1% error bar

#### Example for QWeak

Systematic Uncertainty	Uncertainty	ΔΡ/Ρ (%)
Laser Polarization	0.1%	0.1
Dipole field strength	(0.0011 T)	0.02
Beam energy	1 MeV	0.09
Detector Longitudinal Position	1 mm	0.03
Detector Rotation (pitch)	1 degree	0.04
Asymmetry time averaging	0.15%	0.15%
Asymmetry fit	0.3%	0.3%
DAQ – dead time, eff.	Under study	??

Systematic uncertainties still under investigation, but final precision expected to be better than 1%

 $\rightarrow$  DAQ- related systematics likely the most significant remaining issue to study

#### Conclusions

- Simulation package based on GEMC
  - Electron detector background from Bremsstrahlung and halo are ok at 3,5 and 10 GeV
  - Detector segmentation can go down to 40 strips
  - Halo need to be limited for background and direct strike
  - Vacuum window induce a small correction at lower energyStudy of beam induced background ( outgassing)
- Roman pot based Compton electron detector viable options for Wakefield and Synchrotron standpoint for 1% measurement
