Abstract - A compilation of data on $K_L^0 p$ interactions is presented. The compilation includes data on total and integrated cross sections, differential distributions, coefficients of the Legendre polynomial expansions of the differential distributions. For the $K_S^0 p$ final state are given also the forward cross sections and the phase of the forward scattering amplitude. Polarization data and coefficients of polynomial expansions are tabulated for the $\pi^+ \Lambda^0$ and $\pi^+ \Sigma^0$ final states.

1. INTRODUCTION

In this report a collection of $K_L^0 p$ interaction cross sections is presented. The major part of the data concern integrated cross sections and differential distributions for the reactions:

The forward cross sections and the phase of the forward scattering amplitude are given for reaction (1). Polarization data are given for reactions (2) and (3). Moreover the total cross sections for several inelastic channels are tabulated.

The compilation was started in conjunction with a low energy experiment on $K_L^0 p$ interactions in a bubble chamber⁽¹⁾.

The method used in this data collection, the formats and the notations are similar to those used by the CERN-HERA group⁽²⁾, the Berkeley particle data group⁽³⁾ and in the Landolt-Börnstein compilation⁽⁴⁾. In fact this report may be considered an update of the LBL-55 report⁽³⁾.

The analysis of the literature was stopped on June 30th, 1981.

In any compilation it is difficult to avoid mistakes and omissions. We apologize for them and hope that the authors will inform us of faults, of omissions and of re-analyses.

2. DATA TABLES

This collection has been arranged in the form of data blocks as illustrated in Tables 1 and 2. There are a total of 2455 experimental data points; they are broadly classified in (a) total, integrated elastic and inelastic cross

sections, each with one point per energy, and (b) differential cross sections and polarizations (one angular distribution per energy).

Inside each block the data are arranged in order of increasing energy. For differential cross sections the blocks are further divided into sub-blocks, consisting of an angular distribution at a particular energy.

The third kind of tables lists the coefficients A_1/A_0 of the Legendre polynomial expansion of the angular distributions of reactions (1), (2) and (3) and the coefficients B_1/B_0 of the polarization for reactions (2) and (3).

For the total and integrated cross sections the tables list, for each data point, the following quantities:

PLAB	laboratory momentum of the incident K (GeV/c)
ECM	c.m. total energy (GeV)
PCM	c.m. momentum of the incident particles (GeV/c)
SIGMA	cross section (mb)
ERROR	statistical, or point-to-point error (mb)
SYS ER	sistematic or scale error (%)
TEC	experimental technique used (following the codes of Table 3)
REF	short reference

For the angular distributions the tables list for each momentum a heading containing information similar to that given for the total and integrated cross sections. Then for each data point of the differential cross-sections the tables give:

THLAB	laboratory scattering angle of the meson (degrees)
COSTH*	cosinus of the c.m. scattering angle of the meson
T	four-momentum transfer $(\text{GeV}/c)^2$
DSIG/DOM*	c.m. differential cross section (mb/sr)
ERROR	statistical error on the c.m. differential cross sections (mb/sr)
DSIG/DT	invariant differential cross section $\{\text{mb}/(\text{GeV}/c)^2\}$
ERROR	statistical error on the invariant cross section $\{\text{mb}/(\text{GeV}/c)^2\}$

For each data point of the polarization distribution, after THLAB, COSTH* and T, the tables give:

P	polarization parameter
---	------------------------

ERROR statistical error on the polarization parameter

The kinematical quantities have been computed using the formulae listed in the Appendix. The codes are listed in Table 3.

3. COMMENTS ON THE DATA

The errors quoted in the literature are not completely consistent. For instance some authors quote a separate scale error, while others combine it with the statistical uncertainty. Therefore it is difficult to avoid some inconsistencies⁽²⁾. We quote two errors, a point-to-point error and a systematic one. If the error given in the published paper includes also systematic effects, we quote it, as given by the authors, as a point-to-point error. But we still quote a systematic error, estimated from the type of experiment.

The non monochromaticity of the K_L^0 beams introduces an energy uncertainty; it would often be important to quote an estimate of the energy uncertainty.

Unless specifically stated, we quoted the numbers as published. When the results were presented only in graphic form we wrote to the authors in order to obtain the corresponding numbers. In some cases we were forced to deduce the numbers directly from the graphs or from the compilation of ref. 3.

In the case of several publications concerning the same experiment, we generally quoted only the values from the final publication.

Some specific comments on the data will now be made.

3.1 Cross section normalization

Since the incoming beam is neutral, one cannot have a direct counting of its flux. Most experiments have determined the absolute flux with a separate calibration. In many experiments the $\pi^+ \Lambda^0$ channel was used as a calibration, checking its cross section with the $\pi^- \Lambda$ cross sections measured in

$\bar{K}^- p$ and $\bar{K}^- n$ reactions. Rarely the absolute calibration was performed to better than $\pm 10\%$.

3.2 $S_S \rightarrow S_S$ reaction

For this reactions the data tables give integrated cross sections, differential cross sections, values of the coefficients A_1/A_0 of the Legendre polynomial expansion, the $t=0$ cross section (at low energies it is obtained from the angular dependence of the Legendre polynomial expansion) and the phase of the forward amplitude. This last quantity is computed as:

$$\Phi = \operatorname{tg}^{-1} \left[\operatorname{Im} f(0) / \operatorname{Re} f(0) \right] = \operatorname{tg}^{-1} \left[\frac{(\operatorname{d}\sigma/\operatorname{dt})_{t=0}}{(\operatorname{d}\sigma/\operatorname{dt})_{\text{optical}}} - 1 \right]^{\frac{1}{2}} \quad (4)$$

where:

$$\left(\frac{\operatorname{d}\sigma}{\operatorname{dt}} \right)_{\text{optical}} = \frac{1}{64\pi} \frac{(\sigma_{\bar{K}^- n}^{\text{tot}} - \sigma_{\bar{K}^+ n}^{\text{tot}})^2}{\hbar c} \quad (5)$$

In the literature one often finds the quantity

$$|F| = \frac{f(K^0 p \rightarrow K^0 p)_{t=0} - \bar{f}(\bar{K}^0 p \rightarrow \bar{K}^0 p)_{t=0}}{p_{\text{cm}}} \quad (6)$$

The relation between $|F|$ expressed in mb and $(\operatorname{d}\sigma/\operatorname{dt})_{t=0}$ expressed in $\text{mb}/(\text{GeV}/c)^2$ is:

$$\left(\frac{\operatorname{d}\sigma}{\operatorname{dt}} \right)_{t=0} = \frac{\pi}{4 \times 0.624^2} |F|^2 = 2.017 |F|^2 \quad (7)$$

In the table we only quote $(\operatorname{d}\sigma/\operatorname{dt})_{t=0}$.

3.3 $L_L \rightarrow \pi^+ \Lambda^0$ and $\rightarrow \pi^+ \Sigma^0$ reactions

For this reactions are given: (i) the integrated cross sections; (ii) the

differential cross sections; (iii) the polarizations; (iv) the values of the coefficients A_1/A_0 and B_1/B_0 of the Legendre polynomial expansions.

It may be worth remembering that the c.m. scattering angle ϑ^* is between the incoming K_L^0 and the outgoing π^+ ; the t-value is also between the K_L^0 and π^+ .

3.4 Three and four-body final states

These have been measured only in bubble chamber experiments. The data are very scarce and have relatively large statistical uncertainties.

3.5 The coefficients A_1/A_0 and B_1/B_0

In each energy interval the data were fitted to the Legendre polynomial expansion to determine the coefficients A_1/A_0 and B_1/B_0 . The fits were performed up to the fourth order, in general using the maximum likelihood method on an event by event basis⁽¹⁾. No higher order coefficients were found to be necessary.

4. ACKNOWLEDGEMENTS

We would like to thank all those colleagues who have sent us information and data from their experiments. The cooperation of the members of the BGGPR collaboration is gratefully acknowledged. We thank Mrs. F. Santucci and Dr. F. Viaggi for their friendly cooperation.

APPENDIX

Notations and formulae

In this appendix the symbols and the formulae used in the compilation are defined. Most of the data in this compilation refer to reactions with two particles in the initial and final states, respectively:

where particle 1 (incident particle) is moving and particle 2 (target particle) is stationary in the laboratory system. The kinematical variables of various particles are, if necessary, distinguished by indices which indicate the number of the particle (1 to 4). Quantities defined in the centre-of-mass system (c.m.) are denoted by an asterisk, whereas quantities in the laboratory system (lab.) are asterisk free.

i) Variables of the particles

Momentum	of particle i	\vec{p}_i, \vec{p}_i^*
Kinetic energy	of particle i	T_i, T_i^*
Total energy	of particle i	E_i, E_i^*
Scattering angle	of particle i	θ_i, θ_i^*
Solid angle	of particle i	Ω_i, Ω_i^*

ii) Cross-sections and polarization

σ_{tot}	total cross-section
σ_{el}	elastic cross-section
σ_{in}	inelastic cross-section
$\frac{d\sigma}{d\Omega}$	differential cross-section in lab. system
$\frac{d\sigma}{d\Omega^*}$	differential cross-section in c.m. system
$\frac{d\sigma}{dt}$	invariant differential cross-section
P	polarization parameter P

iii) Notations and kinematical relations

The momentum and the kinetic energy of the incident particle in the lab. system are defined as:

$$p_1 = [T_1^2 + 2m_1 T_1]^{1/2} \quad (A1)$$

$$T_1 = [p_1^2 + m_1^2]^{1/2} - m_1 . \quad (A2)$$

The invariants s and t are defined as

$$\text{total c.m. energy squared: } s = m_1^2 + m_2^2 + 2E_1 m_2 , \quad (\text{A3})$$

four-momentum transfer 1-3 squared:

$$t = m_1^2 + m_3^2 - 2E_1^* E_3^* + 2p_1^* p_3^* \cos \theta_3^* \quad (\text{A4})$$

where

$$p_1^* = \frac{p_1 m_2}{\sqrt{s}}$$

$$p_3^* = \frac{\{[s - (m_3 + m_4)^2][s - (m_3 - m_4)^2]\}^{1/2}}{2\sqrt{s}} \quad (\text{A6})$$

$$E_1^* = [p_1^{*2} + m_1^2]^{1/2} . \quad (\text{A7})$$

The scattering angle is computed, in the c.m. and lab. system respectively, as

$$\cos \theta_3^* = \frac{(t - m_1^2 - m_3^2 + 2E_1^* E_3^*)}{2p_1^* p_3^*} \quad (\text{A8})$$

$$\tan \theta_3 = \frac{\sin \theta_3^*}{\frac{1}{\left[1 - \left(\frac{p_1}{E_1 + m_2}\right)^2\right]^{1/2}} \left(\frac{p_1 E_3^*}{(E_1 + m_2) p_3^*} + \cos \theta_3^* \right)} . \quad (\text{A9})$$

The invariant differential cross-section

$$\frac{d\sigma}{dt} = \frac{\pi}{p_1^* p_3^*} \frac{d\sigma}{d\Omega^*} . \quad (\text{A10})$$

In the tables and figures the following notations have been used:

PLAB	=	p_1
TLAB	=	T_1
ECM	=	\sqrt{s}
PCM	=	p_1^*
THLAB	=	θ_3 (degrees)
COSTH*	=	$\cos \theta_3^*$
T	=	t
