Dr. *Igor Strakovsky* is an experimentalist in fundamental nuclear and particle physics. He received a doctoral degree from the Petersburg Nuclear Physics Institute (PNPI) in 1984 and worked as a research scientist at PNPI before joining the Physics Department at Virginia Tech in 1992 and then the Physics Department at The George Washington University in 1997. He has been a full research professor there since 2009. Since 2022, he is an Honorary Research Fellow of the School of Physics and Astronomy of Glasgow University, UK.

At Virginia Tech, *Igor Strakovsky* was joining the PWA SAID group under the Dick Arndt's leadership. Then he was and is a visiting researcher at TRIUMF, Canada; MAX-lab, Sweden; Juelich FZ and Mainz U., Germany; BNL and JLab, USA. His research is hadronic and electromagnetic physics and nuclear structure. Now his main experimental focus is on Jefferson Lab, in particular, the KLF project where he is a co-spokesperson. KLF has a link to understand the formation of our world in several microseconds after the Big Bang.

Igor Strakovsky is author of well over **350** published papers in peer-review journals with over **17,000** citations and an h-index of **50**. He authored books, ``*Modern Muon Physics: Selected Issues*'' and ``*Neutrino Mass: Past, Present, and Future*'' and he is a Regional *Award Winner* and one of the **15** national Finalists for The 2008 Inspire Integrity Awards of the National Society of Collegiate Scholars' (NSCS) Inspire Integrity Awards, USA. *Particle Data Group* acknowledges our GWU SAID group activity as the PWA source to go to.

C12-18-005	M. Boer	Timelike Compton Scattering Off Transversely Polarized Proton	C	50			C2	4
C12-19-001	M. Amarian	Strange Hadron Spectroscopy with Secondary KL Beam in Hall D	D	200	200	A-	Approved	1

C12-19-001

Scientific Rating: A-

Recommendation: Approved

Title: Strange Hadron Spectroscopy with Secondary KL Beam in Hall D

Spokespersons: M. Amaryan (contact), M. Bashkanov, S. Dobbs, J. Ritman, J. Stevens, I. Strakovsky

Motivation: The spectroscopy of strange baryons and mesons, including their fundamental strong interactions, are the focus of this proposal. New and unique data can be obtained with an intense K_L beam aimed at a hydrogen/deuterium target, using the GlueX apparatus to detect final state particles.

Measurement and Feasibility: The proponents have answered all questions outlined in the PAC47 report. Substantial progress has been made on the issues of simulations: details on backgrounds and background reactions have been demonstrated, a demonstration of partial wave analysis for hyperon production was given. The proponents have demonstrated the measuring technique of missing mass reconstruction, allowing them to extend the measuring range both regarding small, four-momentum transfers and isospin decomposition. No show stoppers have been pointed out by the TAC.

Issues: The PAC strongly recommends that the collaboration intensify their cooperation on two issues. (1) Coordinated leadership must be established together with the host laboratory to address the various technical issues connected with the R&D efforts and construction of the K_L beam. (2) Continuous cooperation with JPAC and associated members is recommended for the development of tools to master the challenges connected with the clean extraction of $K\pi$ scattering, the identification of the exchange processes at small momentum transfers, and the amplitude analysis for Δ final states.

Summary: The future K_L facility will add a new physics reach to JLab, and the PAC is looking forward to see the idea being materialized, in conjunction with the plans for Hall D as spelled out in the 2019 White Paper. The collaboration should now devote all its energy to turn this challenging project into an experimental facility and in parallel prepare for a successful data analysis.

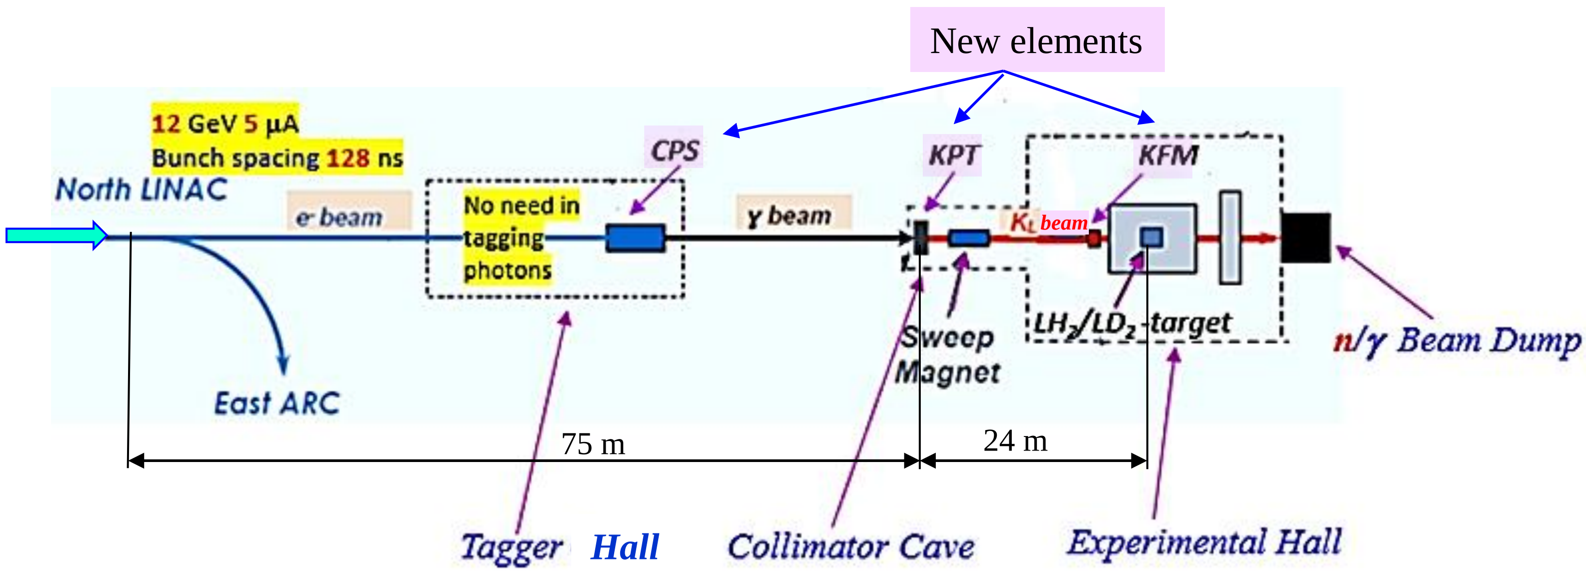
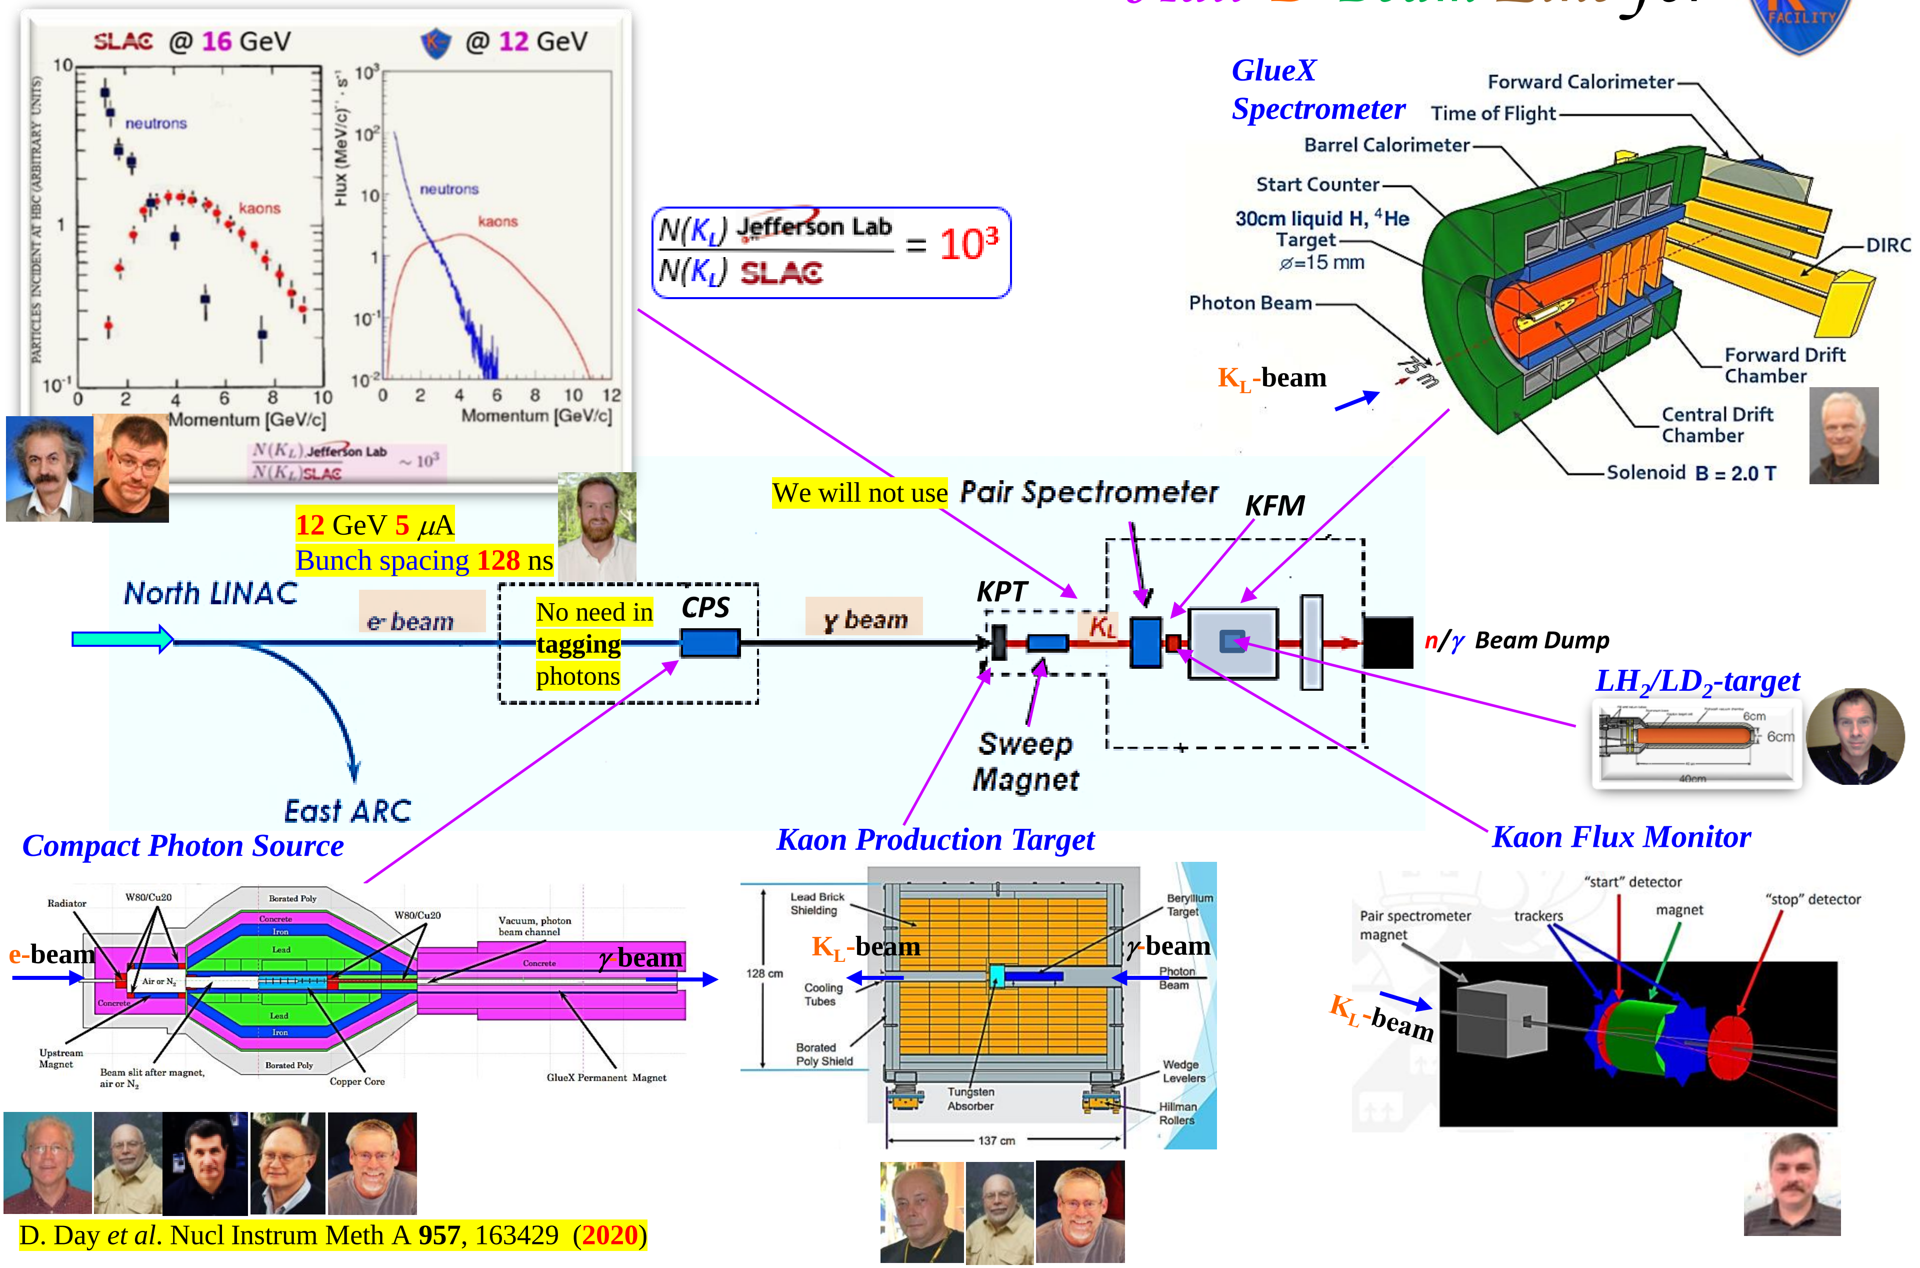
KLF Experiment

Hall D: Beam Line for K-long

- Electrons (3.1×10^{13} e/sec) are hitting Cu-radiator [10% X_0] @ *CPS* located in *Tagger Hall*.
- Photons (4.7×10^{12} γ/sec, E_γ > 1.5 GeV) are hitting Be-target located in *Collimator Cave*.
- Kaons (1×10^4 K_L/sec) are hitting Cryo target within ***GlueX*** setting.
- Neutrons (6.6×10^5 n/sec) are hitting Cryo target within ***GlueX*** setting.
- Photons (6.5×10^5 γ/sec, E_γ > 100 MeV) are hitting Cryo target within ***GlueX*** setting.



Hall D Beam Line for



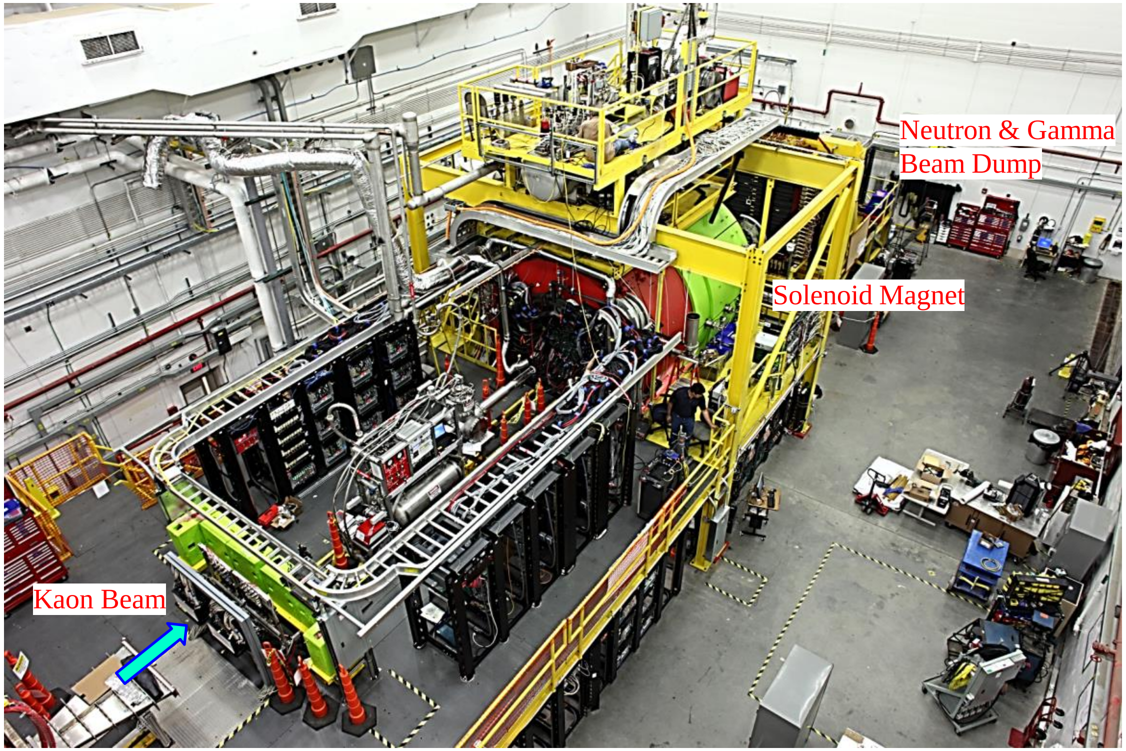
D. Day *et al.* Nucl Instrum Meth A **957**, 163429 (**2020**)

Hall D for KLF

S. Adhikari *et al*, Nucl Inst Meth **987**, 164807 (**2021**)

- Superior ***CEBAF*** electron beam will enable flux on order of ***10^4*** *K_L/sec*, which exceeds flux of that previously attained @ SLAC by *three orders* of magnitude.

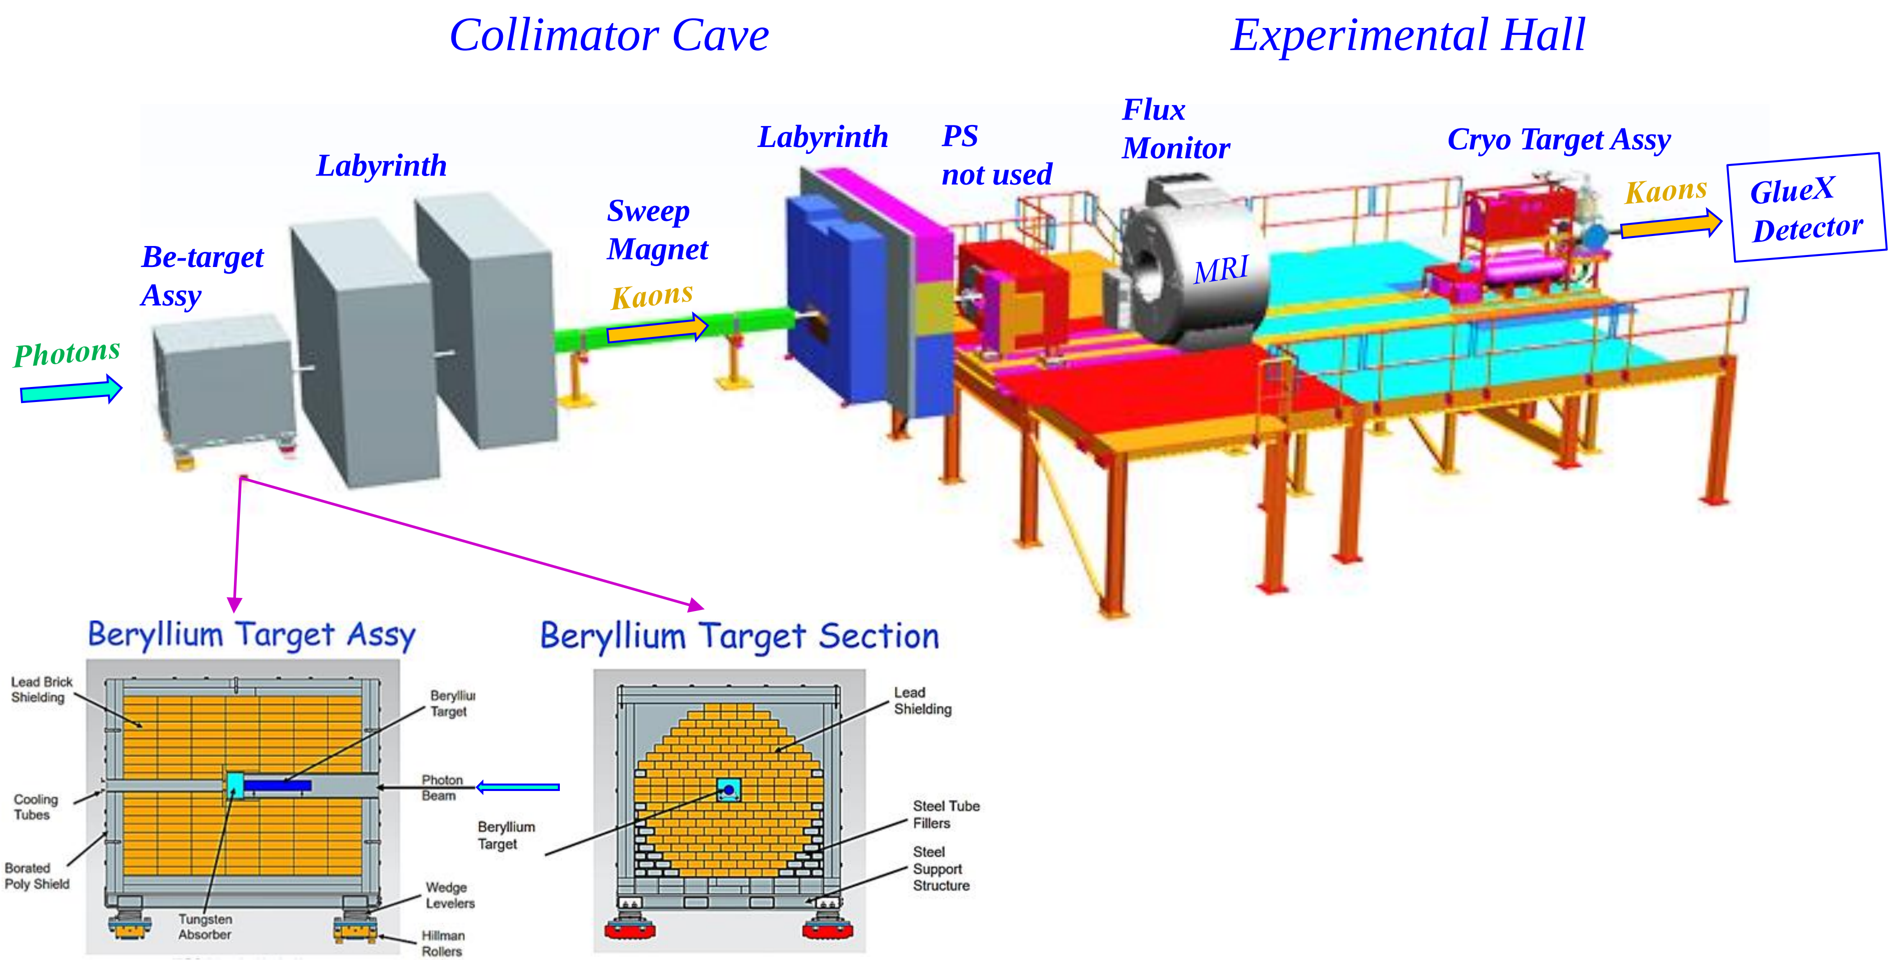
Experimental Hall



Tagger Hall

Collimator Cave

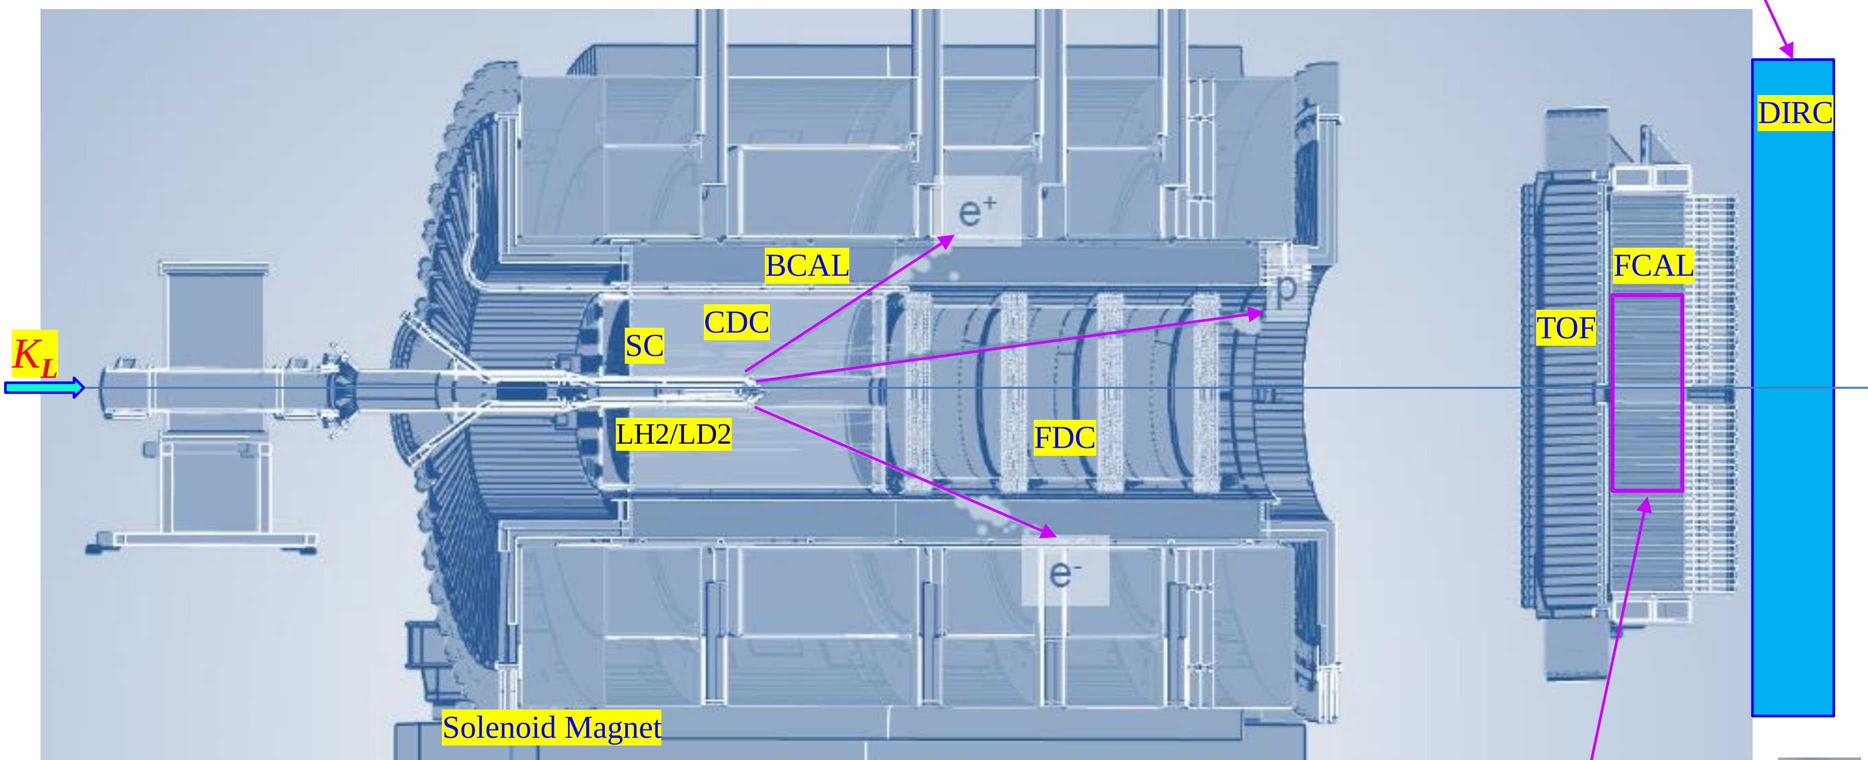
Hall D Setting [Engineering Design]



GlueX Spectrometer for KLF

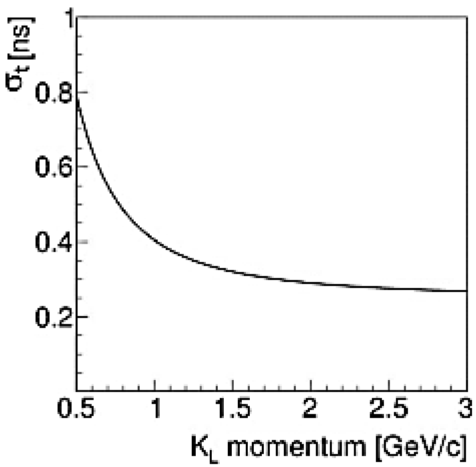
S. Adhikari *et al*, Nucl Inst Meth **987**, 164807 (**2021**)

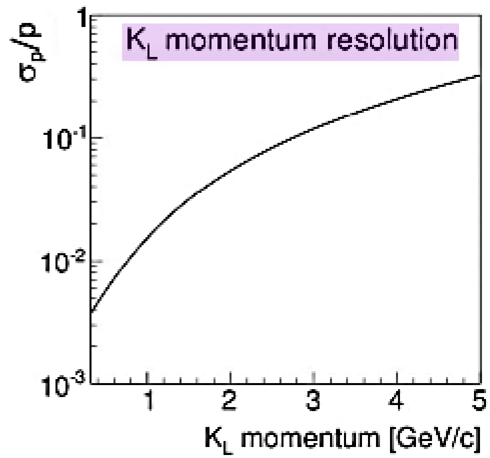
- **DIRC** is new .
  it came recently

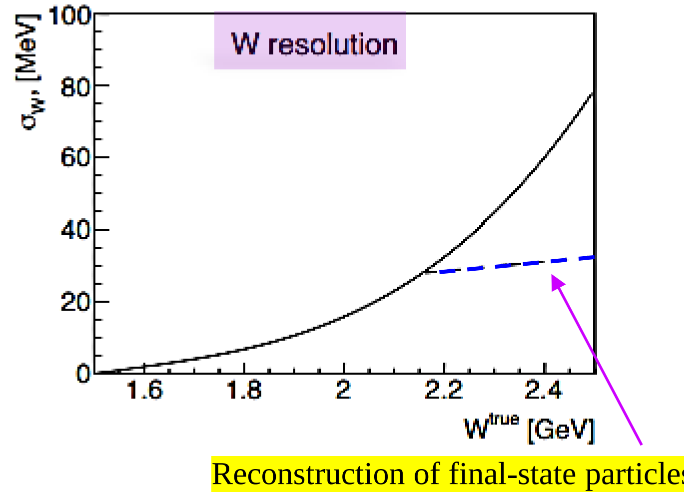


- **FCAL II** is coming with **1,600** $PbWO_4$ crystals using GW help. .

KL Momentum Determination & Beam Resolution



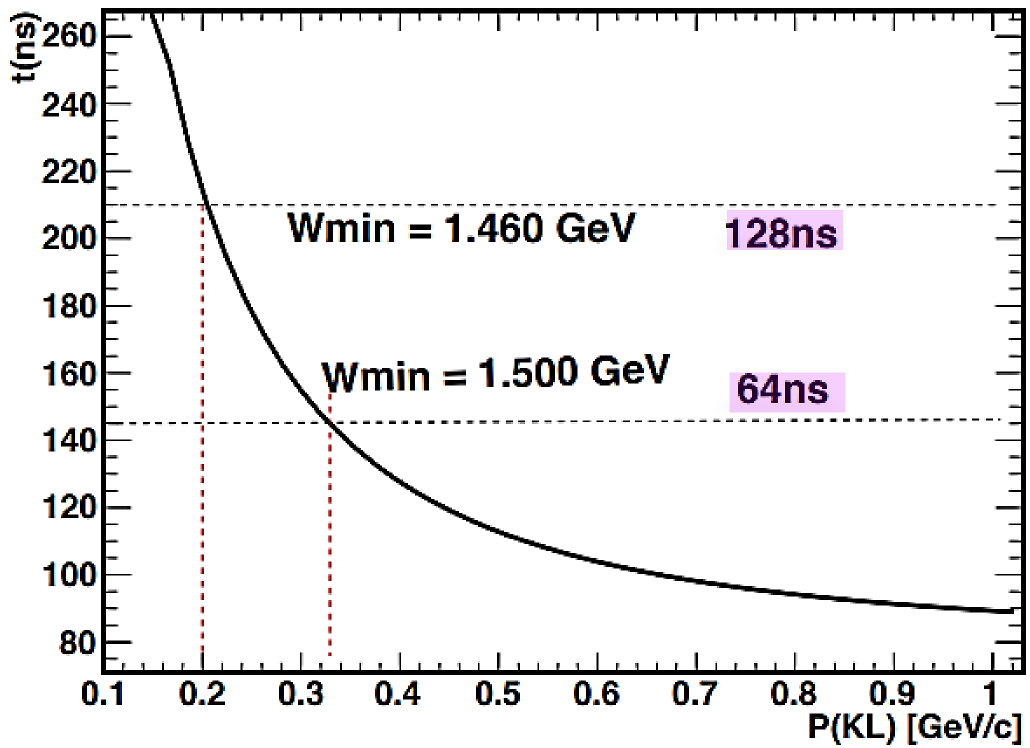




- Momentum measured with *TOF* between *SC* (surrounded *LH_2/LD_2*) & *RF* from *CEBAF*.
- ***Mean lifetime*** of **KL** is 51.16 nsec (**cτ** = 15.3 m) whereas the mean lifetime of **K⁻** is 12.38 nsec (**cτ** = 3.7 m).
- For this reason, it is much easier to perform measurements of KL-p scattering @ low beam energies compared with K-p scattering.

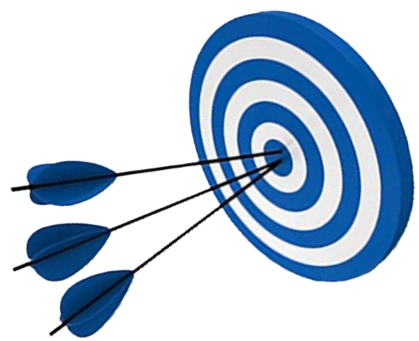
Electron Beam Parameters

- E_e = 12 GeV I = 5 μA
- Bunch spacing 64 ns



- 128 ns confirmed feasible

Aims of KLF Project



We Can Do It, but Why?

- Why to use *kaon beam*? What is advantage compared to *electrons* or *photons* **?**
- What is so special about *K-long* compared to *charged kaon* beam **?** Complimentary to J-PARC.
- What is advantage of producing secondary kaon beam with *EM* probe, compared to *proton* beam **?**
- How much Jefferson Lab accelerator could make breakthrough compared to previous results @SLAC**?**
- Why to do this K LONG FACILITY experiment, what are we going to learn **?**
- How will it affect our knowledge on *Hyperon Spectroscopy* **?**
- What are we going to learn about *Strange Meson Spectroscopy* **?**
- Is this K LONG FACILITY experiment about "*stamp collection*" or what **?**

- There are many more *questions* - some constructive & some less so - answers to which shaped approved K LONG FACILITY experiment.

THREEFOLD *Highlights*

- project has firmly to setup secondary K_L beamline @ Jefferson Lab, with *flux* of *three order of magnitude higher* than SLAC had, for scattering experiments on both *proton* & *neutron* (*first* time !) targets.

- *CEBAF* will remain ***prime facility*** for fixed target electron scattering @ luminosity ***frontier***. *First hadronic facility* @ Jefferson Lab.

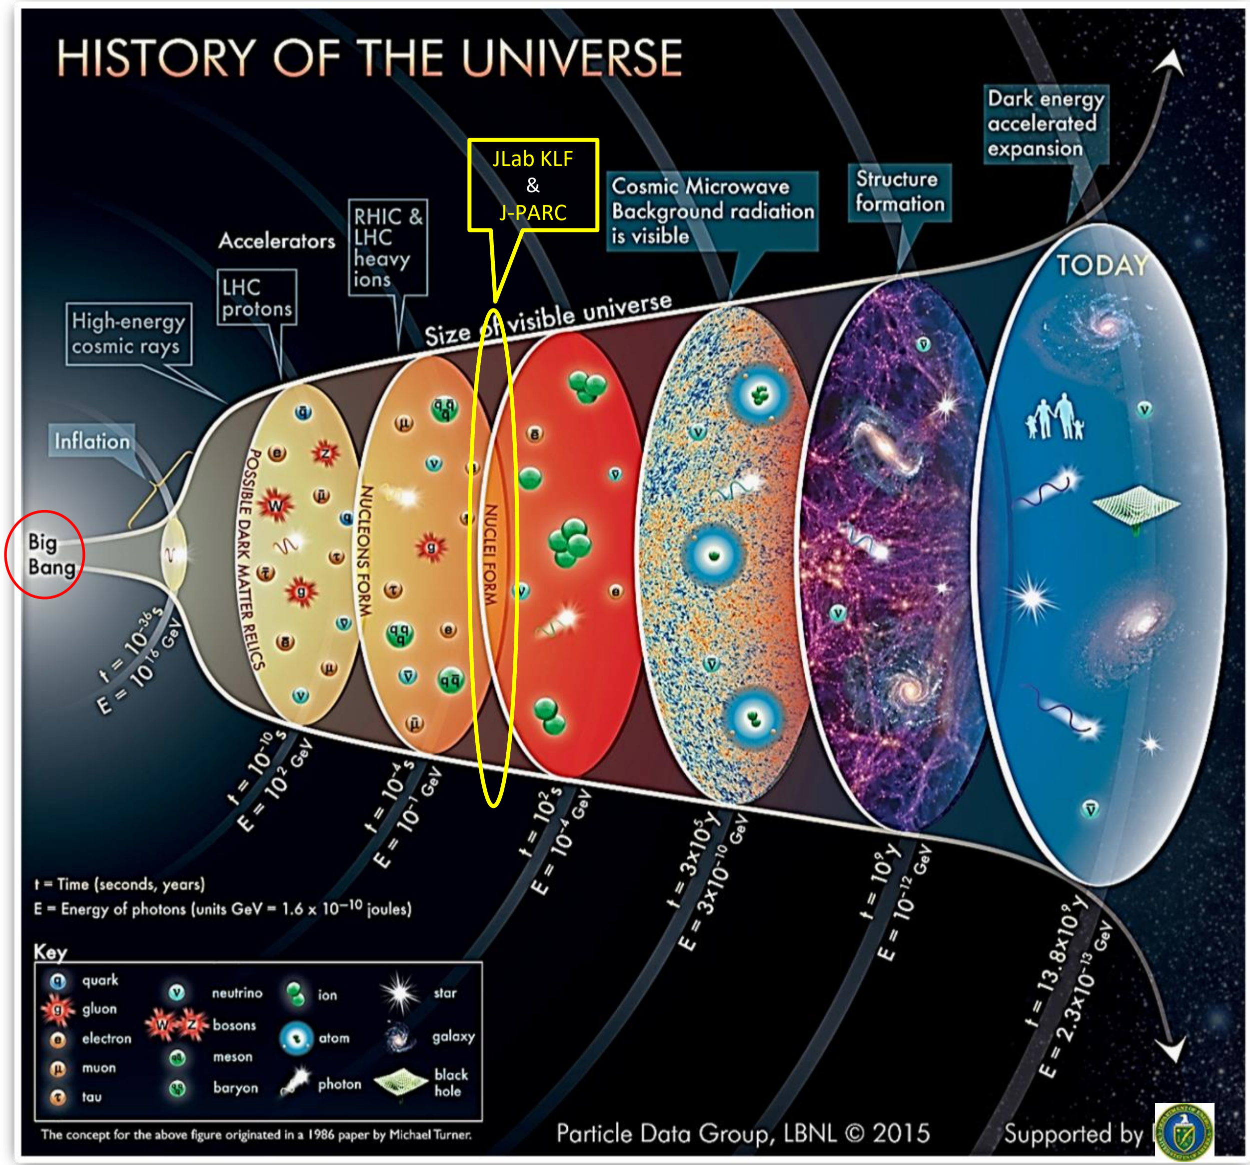
- We will determine differential cross sections & self-polarization of *hyperons* with ***GlueX*** detector to enable precise *PWA* in order to determine ***all*** *resonances* up to 2500 MeV in spectra of Λ^*, Σ^*, Ξ^*, & Ω^*. To complete $SU(3)_F$ *multiplets*, one needs no less than 48 Λ^*, 38 Σ^*, 61 Ξ^*, & 31 Ω^* .

- We intend to do *strange meson spectroscopy* by studies of π-K interaction to locate *pole* positions in I = 1/2 & 3/2 channels.

- has link to *ion-ion high energy* facilities as CERN & & will allow understand formation of our world in *several microseconds* after *Big Bang*. *Hyperons* are playing ***leading*** role to reproduce *Chemical Potential*.

Impact to Study Early Universe

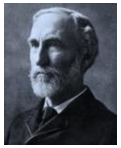
History of the Universe



- is *Home* of *Hot Big Bang Theory*.

- Omission of any ``*missing hyperon states"* in *Standard Model* will negatively impact our understanding of *QCD freeze-out* in heavy-ion & hadron collisions, ***hadron spectroscopy***, & *thermodynamics* of *Early Universe*.
- For that reason, advancing our understanding of formation of *baryons* from ***quarks*** & ***gluons*** requires new experiments to search for any *missing hyperon* resonances.

Thermodynamics @ *Freeze-Out*

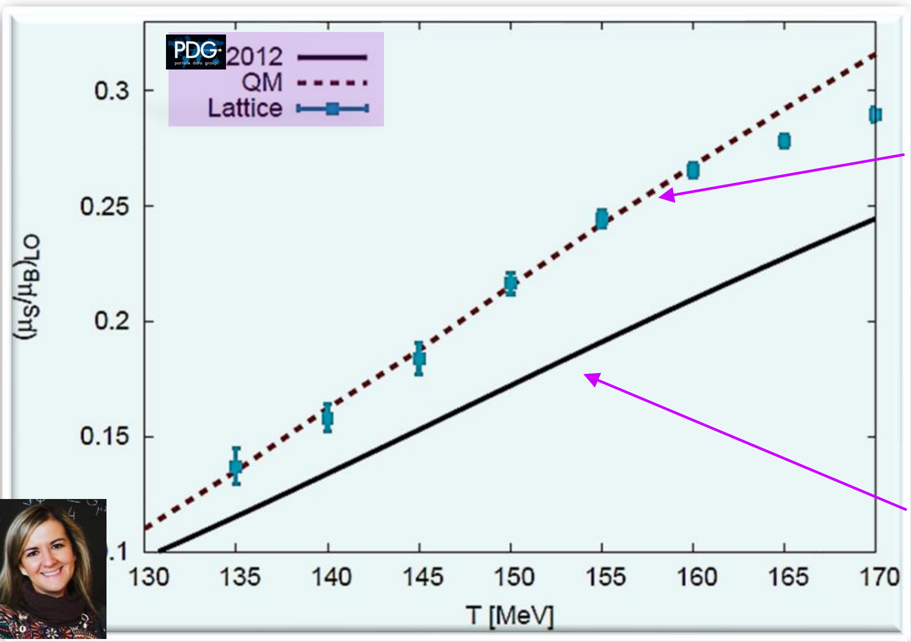


Josiah Willard Gibbs

- In *thermodynamics*, *chemical potential* of *species* is *energy* that can be absorbed or released due to change of particle number of given species, *e.g.*, in chemical reaction or phase transition.
- *Chemical potential* of species in mixture is defined as rate of change of free energy of thermodynamic system with respect to change in number of atoms of species that are added to system.
- @ *chemical equilibrium* or in *phase equilibrium*, total sum of product of *chemical potentials* & stoichiometric coefficients is zero, as free energy is @ minimum.

Rolf Hagedorn

- Recent studies that compare *LQCD* calculations of *thermodynamic*, statistical *Hadron Resonance Gas* models, & ratios between measured yields of different hadron species in heavy ion collisions provide indirect evidence for presence of ”*missing*” resonances in all these contexts.



Chemical Potential

$$\left(\frac{\mu_S}{\mu_B}\right)_{LO} = -\frac{\chi_{11}^{BS}}{\chi_2^S} - \frac{\chi_{11}^{QS}}{\chi_2^S}\frac{\mu_Q}{\mu_B}$$

- + ``*Missing*” *Resonances* (*CQM*/*LQCD* calculations).

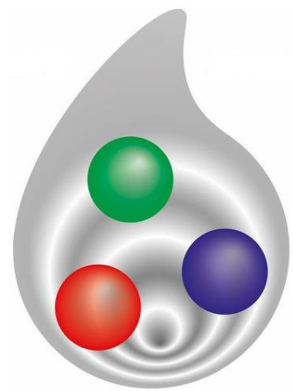
Contribution order:
- ***Hyperons***
- Non-strange ***Baryons***
- ***Mesons***
- Light ***Nuclei***

- Contribution from *observed Resonances*. PDG

- The *Early Universe* was *Strange*.

Courtesy of Claudia Ratti, YSTAR2016

Hyperon Spectroscopy

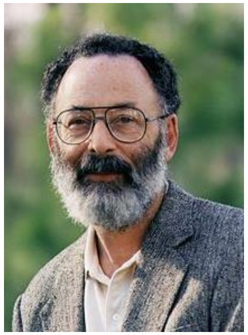


It is clear that we still need much more information about the existence and parameters of many baryon states, especially in the N=2 mass region, before this question of non-minimal SU(6) x O(3) super-multiplet can be settled.

Dick Dalitz, **1976**

The first problem is the notion of a resonance is not well defined. The ideal case is a narrow resonance far away from the thresholds, superimposed on slowly varying background. It can be described by a Breit-Wigner formula and is characterized by a pole in the analytic continuation of the partial wave amplitude into the low half of energy plane.

Gerhard Höhler, 1987



*Why N*s are important – The first is that nucleons are the stuff of which our world is made. My second reason is that they are simplest system in which the quintessentially non-Abelian character of QCD is manifest. The third reason is that history has taught us that, while relatively simple, Baryons are sufficiently complex to reveal physics hidden from us in the mesons.*

Nathan Isgur, **2000**

- First *hyperon* was discovered in **1950**.

V.D. Hopper & S. Biswas, Phys Rev **80**, 1099 (1950)

- Pole position in complex energy plane for *hyperons* has made *only* in **2010**.

Y. Qung *et al*, Phys Lett B **694**, 123 (2010)

- PDG2022 has 133 Baryon Resonances (69 of them are 4* & 3*).
- In case of SU(6) x O(3), 434 states would be present if all revealed multiplets were fleshed out (*three* 70 & *four* 56).

- LQCD results are similar.

R. Koniuk & N. Isgur, Phys Rev Lett **44**, 845 (1980)

Jefferson Lab

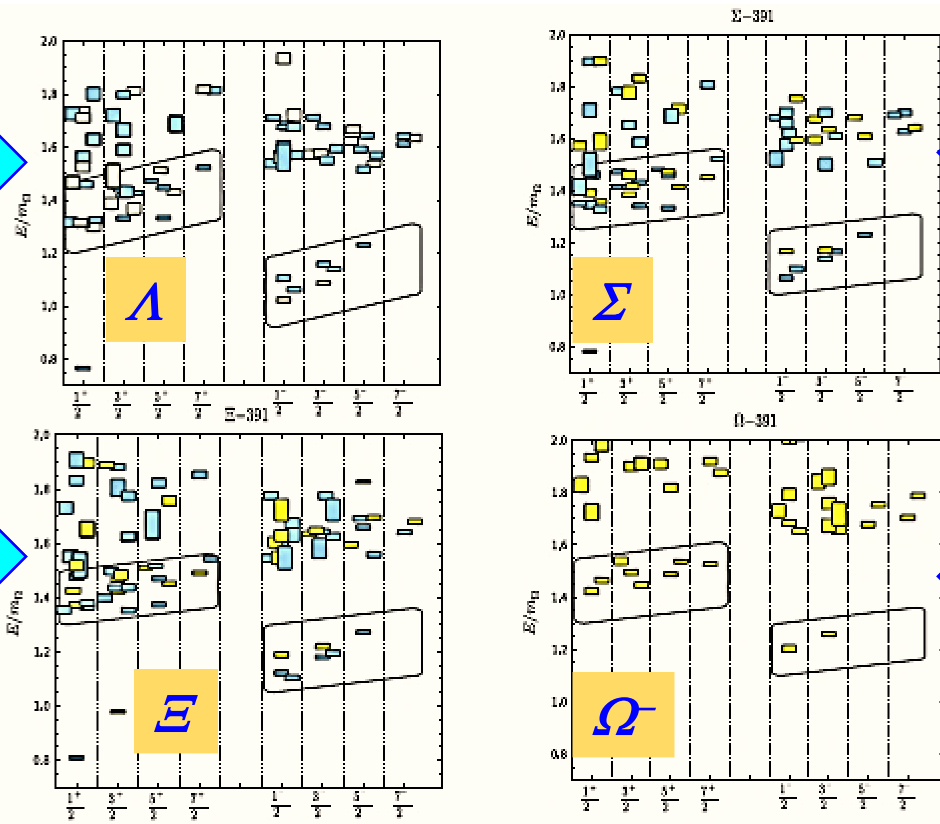
LQCD for Hyperon Spectroscopy

had spec

PDG particle data group

8-states ****	5-states ***

6-states ****	4-states ***



3-states ****	4-states ***

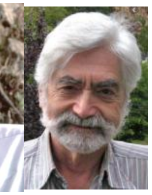
1-state ****	1-state ***

m_π = 391 MeV
M < $2M_\Omega$

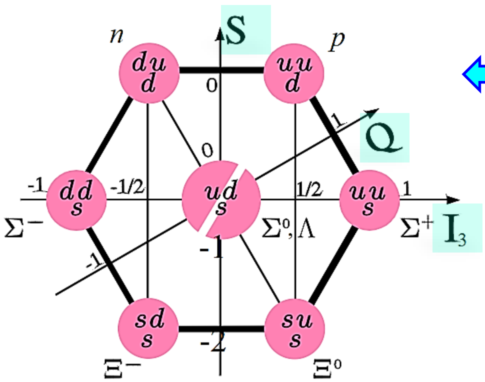
- According to *LQCD*, there are should be more than 400 states including *hybrids* (thick bordered).

R. G. Edwards *et al*, Phys Rev D **87**, 054506 (**2013**)

Baryon Multiplets of Eight-fold Way

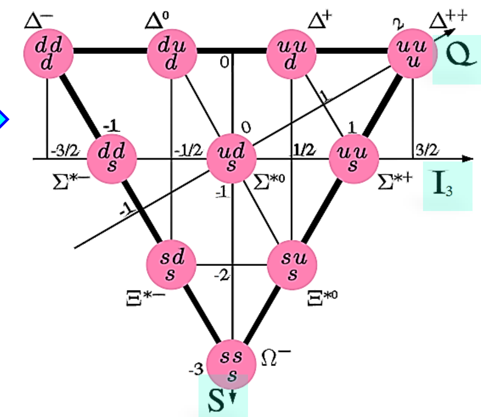


- **Three light quarks** can be arranged in 6 baryonic families, N*, Δ*, Λ*, Σ*, Ξ*, & Ω*.
- Number of members in family that can exist is not arbitrary.
- If $SU(3)_F$ symmetry of *QCD* is controlling, then:



Spin 1/2 baryon octet: N^*, Λ^*, Σ^*, Ξ^*

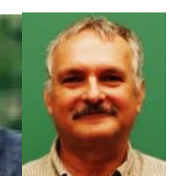
Spin 3/2 baryon decuplet: Δ^*, Σ^*, Ξ^*, Ω^*



had/spec PDG

Resonance	LQCD	Observed
N^*	62	36
Δ^*	38	29
Λ^*	71	23
Σ^*	66	28
Ξ^*	73	12
Ω^*	36	5

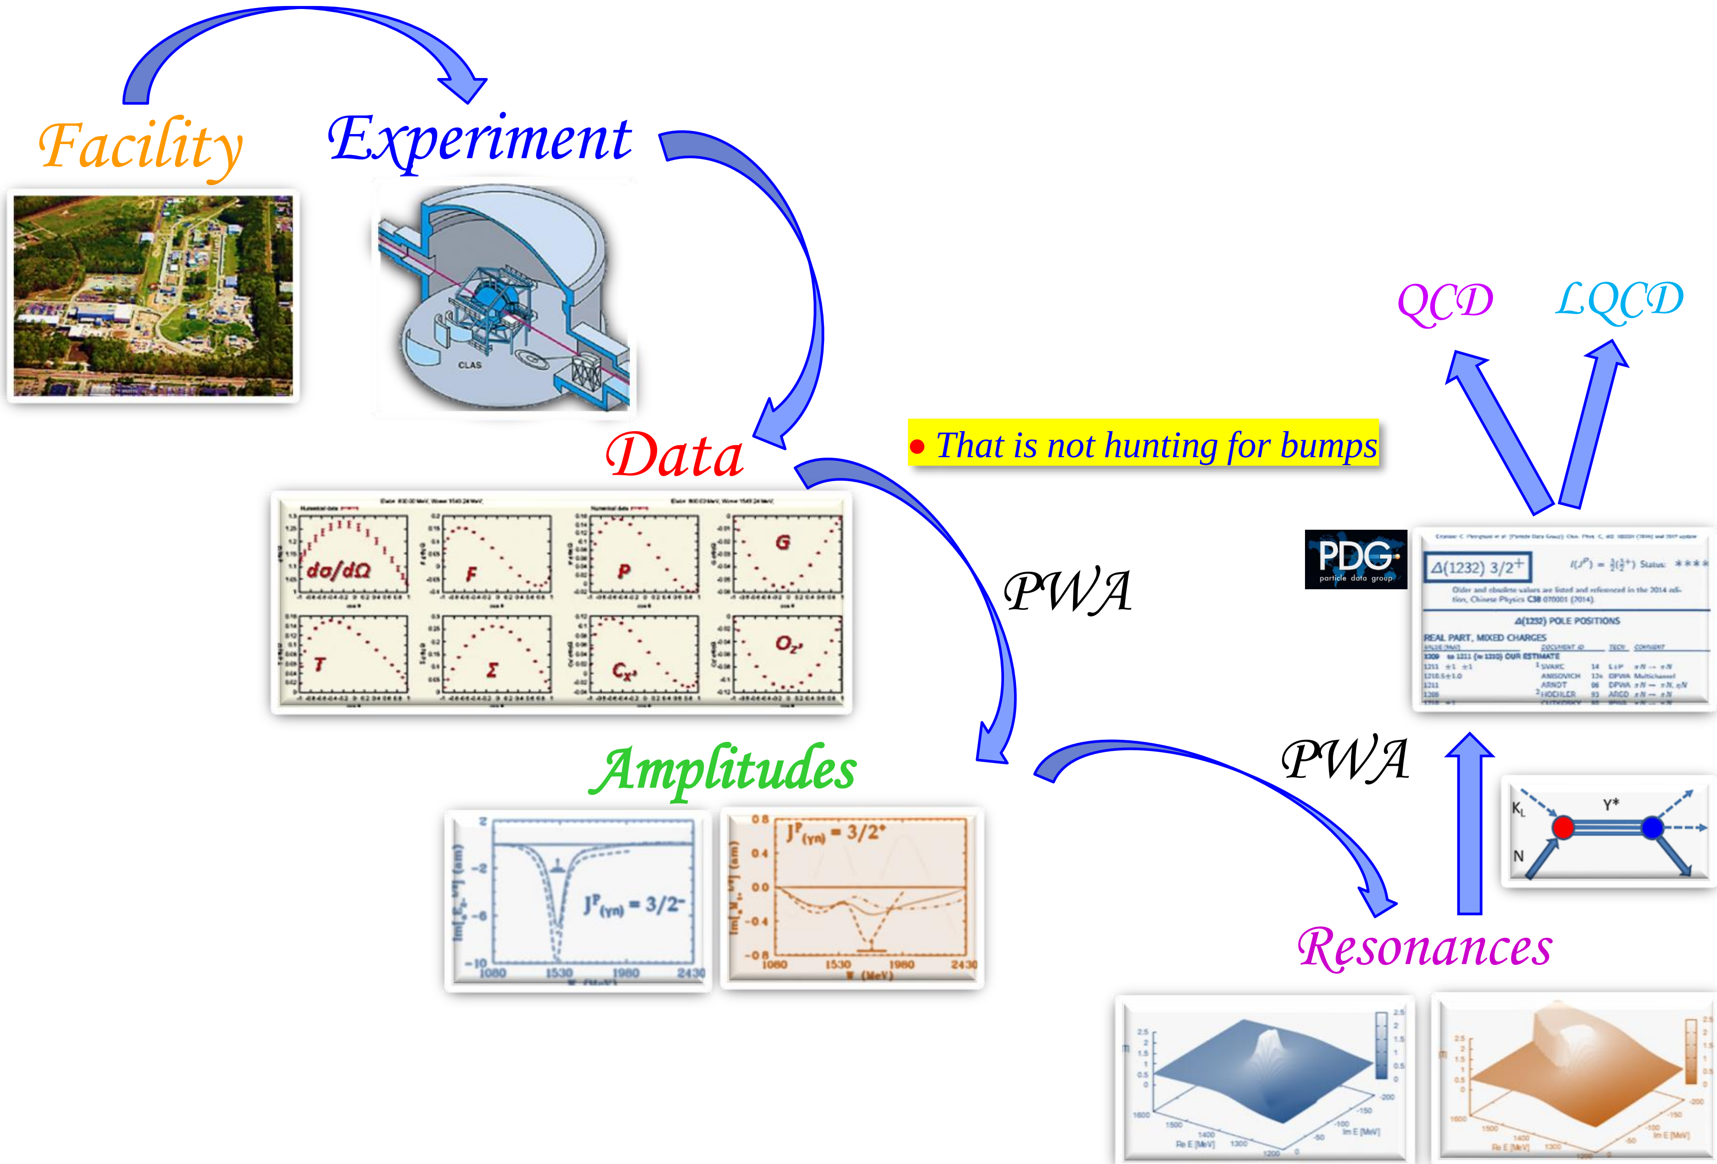
R. G. Edwards *et al*, Phys Rev D **87**, 054506 (2013): $M < 2M_\Omega$



- Seriousness of "*missing-states*" problem is obvious from these numbers.
- One needs to *complete* $SU(3)_F$ multiplets.

B.M.K. Nefkens, πN Newsletter, **14**, 150 (1997)

Road Map to Baryon Spectroscopy

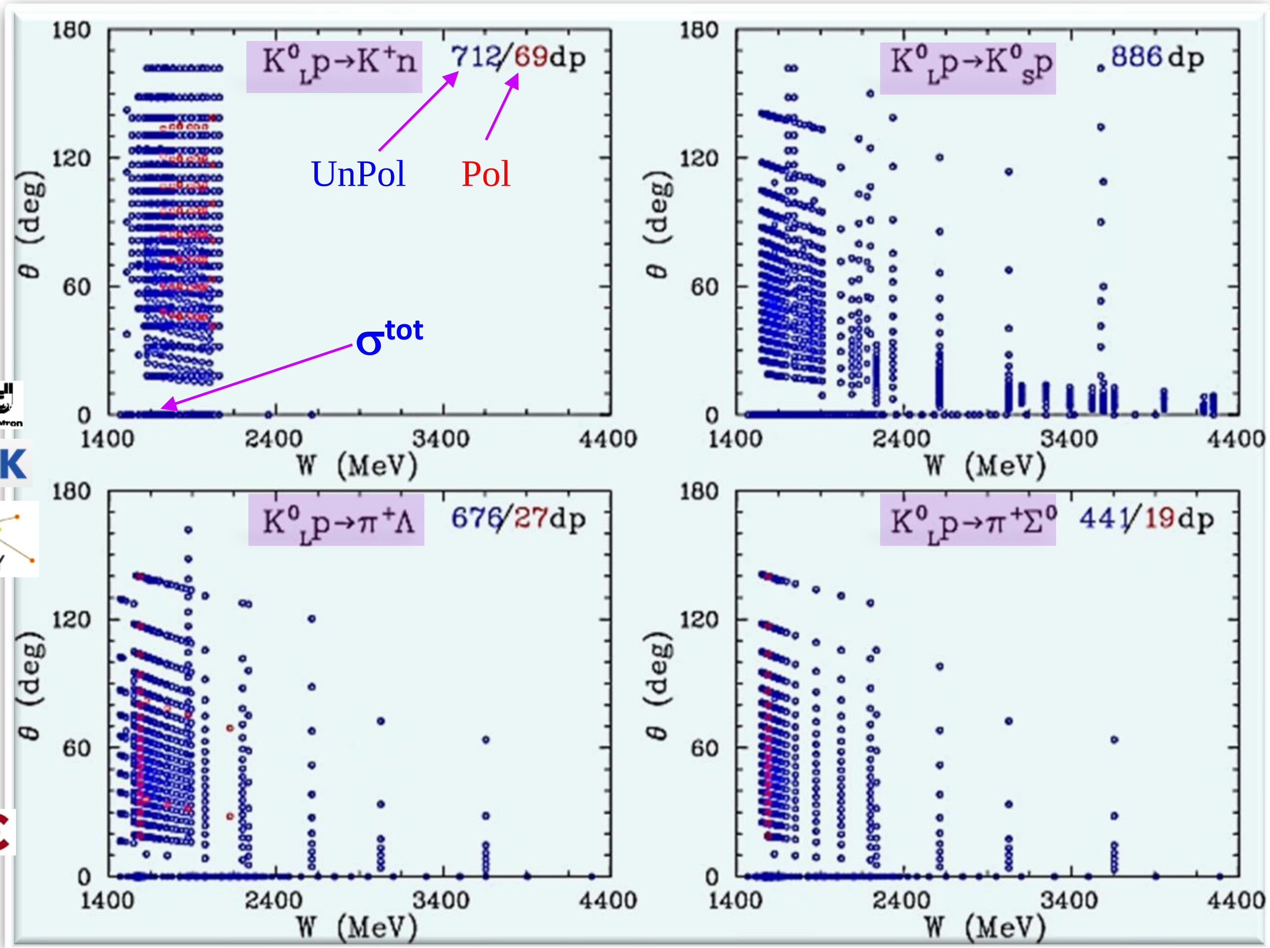


World K–long Data – Ground for Hyperon Phenomenology

SAID: http://gwdac.phys.gwu.edu/

W = 1.45 – 5.05 GeV

- Limited number of K_L induced measurements (1961 – 1982) 2426 $d\sigma/d\Omega$, 348 σ^{tot}, & 115 P observables do not allow today to *feel comfortable* with *Hyperon Spectroscopy* results.



- Limited number of K_L observables in *hyperon spectroscopy* @ present poorly constrain phenomenological analyses.

- *Overall systematics* of previous experiments varies between 15% & 35%. *Energy binning* is much broader than hyperon widths.

- There were **no** measurements using *polarized target*. It means that there are no *double polarized* observables which are critical for *complete experiment* program.

- We are not aware of any data on ***neutron*** target.

- Originally PWA arose as technology to determine amplitude of reaction via fitting scattering data.

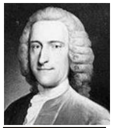
  ⇒ That is *non-trivial mathematical problem* – looking for solution of ill-posed problem following to Hadamard & Tikhonov. [number of equations less than number of unknown quantities]

  ⇒ There are two main technologies to look for solution:

  (i) *least-squares minimization* of functions which are linear in unknown parameters, χ^2 &

  (ii) *likelihood measures goodness* of fit of statistical model.

  [*Minimizing* χ^2 is equivalent to *maximizing* (log) likelihood just case not small statistics]



Roger Cotes

Sir Ronald Aylmer Fisher

  ⇒ Model *independent* treatment or data *driven* treatment.

- Resonances appeared as by-product
  [bound states objects with definite quantum numbers, mass, lifetime, & so on].

- Standard PWA
  ⇒ Reveals only wide Resonances, but not too wide (**Γ** < 500 MeV) & possessing not too small BR (BR > 4%).
  ⇒ Tends (by construction) to miss narrow Resonances with **Γ** < 20 MeV.

PWA Formalism for πN Elastic Scattering

G. Höhler, *Pion-Nucleon Scattering*, Landoldt-Boernstein Vol. **I/9b2**, edited by H. Schopper (Springer, **1983**)

- Differential cross section & polarization for πp elastic scattering:

$$\frac{d\sigma}{d\Omega} = \lambda\!\!\!^{-2}(|f|^2 + |g|^2)$$

$$P\frac{d\sigma}{d\Omega} = 2\lambda\!\!\!^{-2}\,\mathrm{Im}(fg^*)$$

$\lambda\!\!\!^{-} = \hbar/k$ & k is momentum of incoming pion in CM.

$f(W,\theta)$ is non-spin-flip
$g(W,\theta)$ is spin-flip
amplitudes @ W & θ.

- In terms of partial waves, $f(W,\theta)$ & $g(W,\theta)$ can be expanded as

$$f(W,\theta) = \sum_{l=0}^{\infty}[(l+1)T_{l+} + lT_{l-}]P_l(\cos\theta)$$

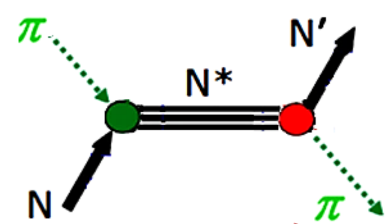
$$g(W,\theta) = \sum_{l=1}^{\infty}[T_{l+} - T_{l-}]P_l^1(\cos\theta)$$

l is initial *orbital* angular momentum:

$P_l(\cos\theta)$ is Legendre polynomial.
$P_l'(\cos\theta)$ is associated Legendre function.

J is total *angular* momentum:
for T_{l+} is $J = l + 1/2$,
for T_{l-} is $J = l - 1/2$.

- πN elastic scattering data allowed establishment of **4**-star resonances ⇒



K-Long – Basic

- K-Long is CP *eigenstate* & superposition of strong *eigenstates* according to

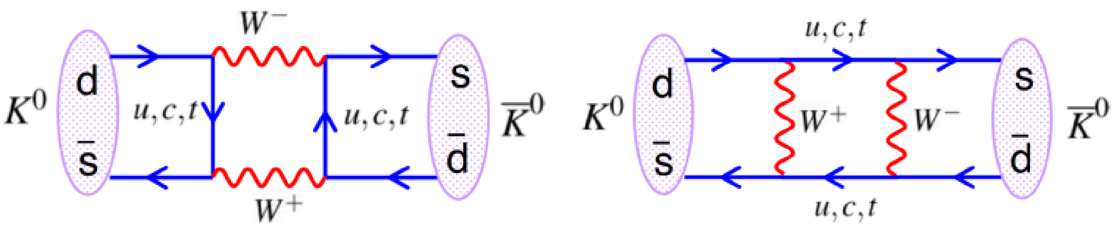
$$K_L^0 = \frac{1}{\sqrt{2}}(K^0 - \overline{K^0})$$

τ = 5.12 x 10^{-8} s

$$K_S^0 = \frac{1}{\sqrt{2}}(K^0 + \overline{K^0})$$

τ = 8.95 x 10^{-11} s

- *Weak* interaction allows for mixing of strong *eigenstates*:



- K-Long produces in general combinations of different *isospin* & *strangeness* channels, *e.g.*:

$$T(K_L^0 p \to K_L^0 p) = \frac{1}{2}\left(\frac{1}{2}T^1(KN \to KN) + \frac{1}{2}T^0(KN \to KN)\right) + \frac{1}{2}T^1(\overline{K}N \to \overline{K}N)$$

$$T(K_L^0 p \to \pi^+ \Lambda) = -\frac{1}{\sqrt{2}}T^1(\overline{K}N \to \pi\Lambda)$$

What Can Be Learned with K_L Beam ?

Target ⟹ **Proton** | **Neutron** [*first* measurements]

	Proton	Neutron
Elastic & Charge-Exchange	$K_L p \to K_S p$ $K_L p \to K^+ n$	$K_L n \to K_S n$ $K_L n \to K^- p$
Two-body with $S = -1$	$K_L p \to \pi^+ \Lambda$ $K_L p \to \pi^+ \Sigma^0$	$K_L n \to \pi^0 \Lambda$ $K_L n \to \pi^0 \Sigma^0$
Two-body with $S = -2$	$K_L p \to K^+ \Sigma^0$ $K_L p \to K^+ \Sigma^{0*}$	$K_L n \to K^0 \Sigma^0$ $K_L n \to K^0 \Sigma^{0*}$
Three-body with $S = -2$	$K_L p \to \pi^+ K^+ \Sigma^-$ $K_L p \to \pi^+ K^+ \Sigma^{-*}$	$K_L n \to \pi^+ K^- \Sigma^0$ $K_L n \to \pi^+ K^- \Sigma^{0*}$
Three-body with $S = -3$	$K_L p \to K^+ K^+ \Omega^-$ $K_L p \to K^+ K^+ \Omega^{-*}$	$K_L n \to K^+ K^0 \Omega^-$ $K_L n \to K^+ K^0 \Omega^{-*}$

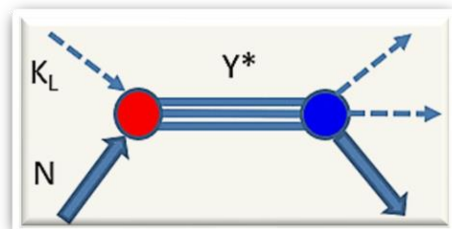
- To search for ``*missing*'' hyperons, we need measurements of production reactions:

Σ^*: $K_L^0 p \to \pi \Sigma^* \to \pi\pi\Lambda$

Λ^*: $K_L^0 p \to \pi \Lambda^* \to \pi\pi\Sigma$

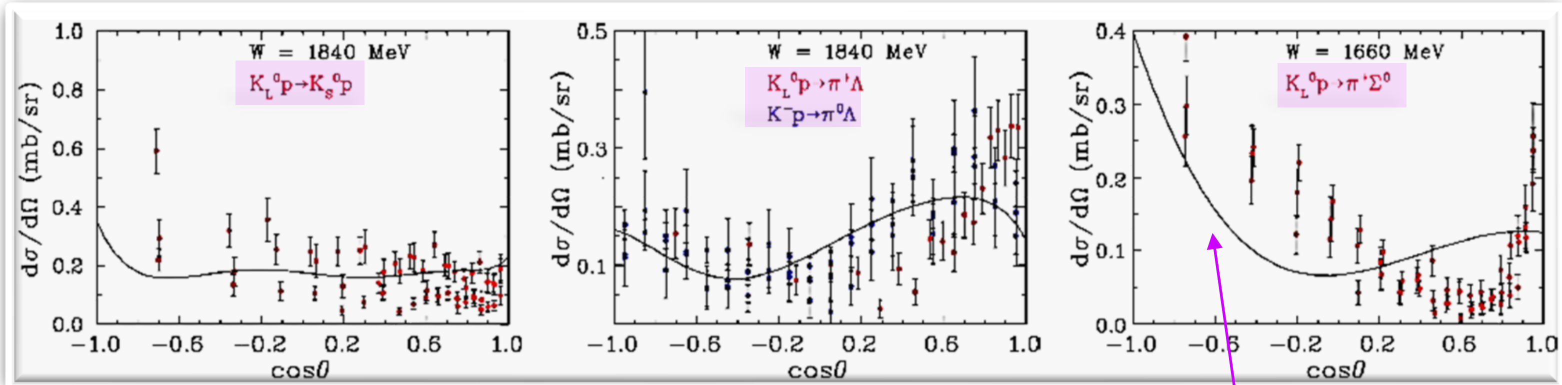
Ξ^*: $K_L^0 p \to K\Xi^*, \pi K \Xi^*$

Ω^*: $K_L^0 p \to K^+ K^+ \Omega^*$

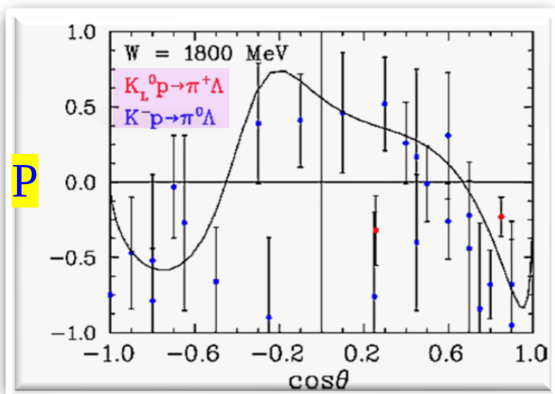


Samples of PWA Results for Current DB

H. Zhang *et al* Phys Rev C **88**, 035204 (**2013**)
H. Zhang *et al* Phys Rev C **88**, 035205 (**2013**)



- *PWA* (&) predictions at lower & higher energies have poorer agreement for ***S ≠ 0*** data than for ***S = 0*** data.



- Polarized measurements are *tolerable* for any *PWA* solutions.

Expected Cross Sections vs Bubble Chamber Data

- measurements will span $\cos\theta$ from -0.95 to 0.85 in CM above W = 1490 MeV.

- Uncertainties (statistics only) correspond to 100 days of running time for:

$K_L p \to K_S p$

$K_L p \to \pi^+ \Lambda$

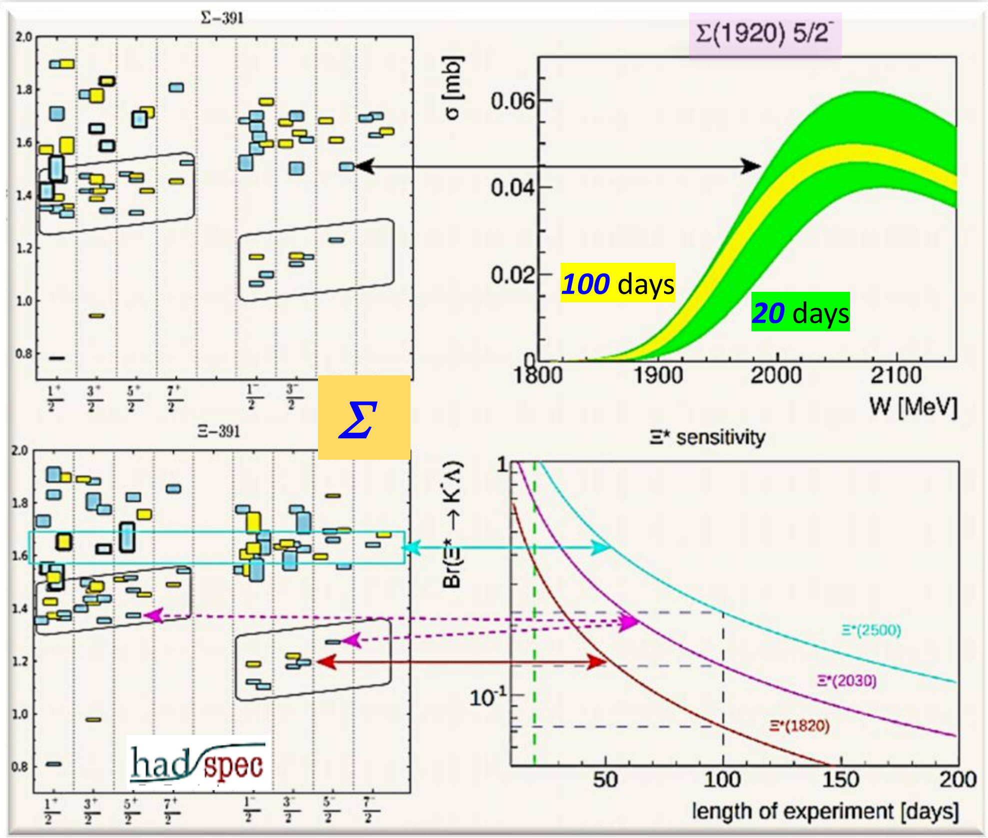
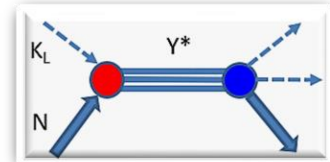
Summary of Hyperon Spectroscopy



- We showed that KLF sensitivity with *100 days* of running will allow to discovery many *hyperons* with good precision.

- *Why should it be done with KL beam* ?
  This is only realizable way to observe ***s***-channel resonances having ***all momenta*** of *KL* @ once (``*tagged*'' *kaons*) .

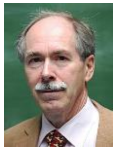


- *Why should it be done* @ Jefferson Lab ?
  Because nowhere else in existing facilities this can be done.

- *Why should we care that there are dozens of missing states* ?

…The new capabilities of the 12-GeV era facilitate a detailed study of baryons containing two and three strange quarks. Knowledge of the spectrum of these states will further enhance our understanding of the manifestation of QCD in the three-quark arena.
2015 Long Range Plan for Nuclear Science

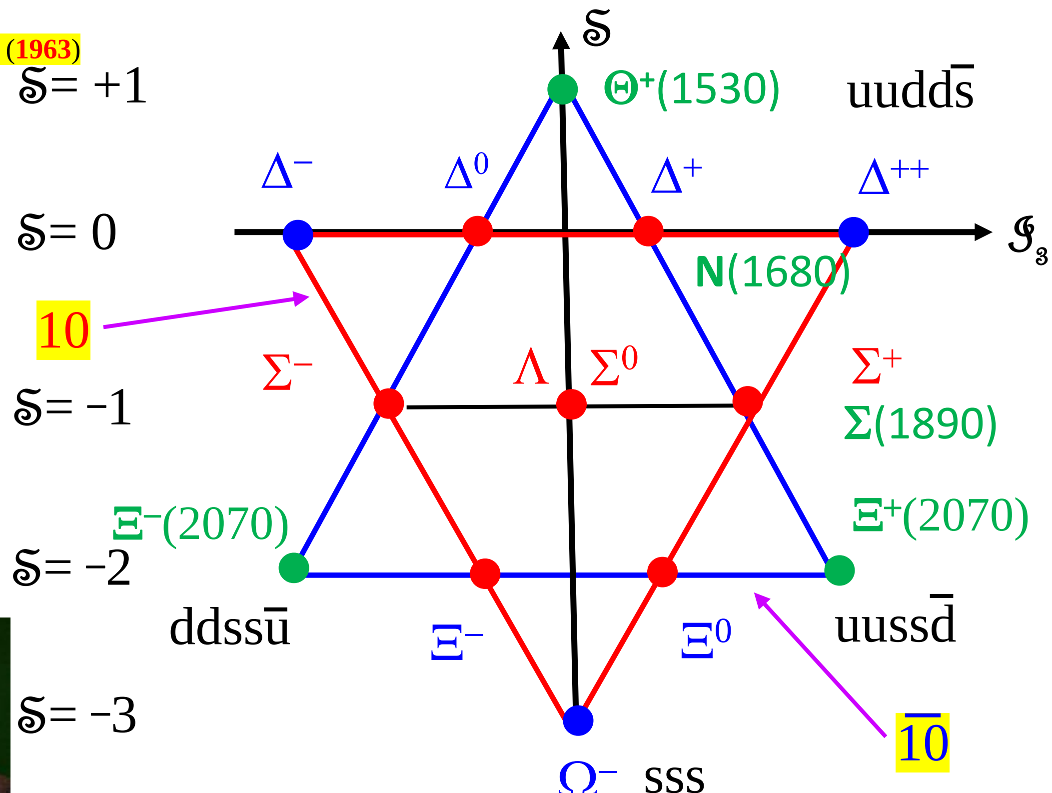
Anyone can ask Big Questions, but it is not easy to ask questions that would suggest new pathways leading to real progress of our understanding. Courtesy of Gerard ‘t Hooft, **2022**



What Else ?

10 & $\overline{10}$ – P wave Multiplets

J.J. de Swart, Rev Mod Phys **35**, 916 (**1963**)



$K_L p \to K^+ n$

$K_L p \to K_S \Xi^+$

• ***Big Question***: if there is *no exotics* then **WHY ?**

D. Diakonov, V. Petrov, & M.V. Polyakov, Z. Phys. A **359**, 305 (**1997**)

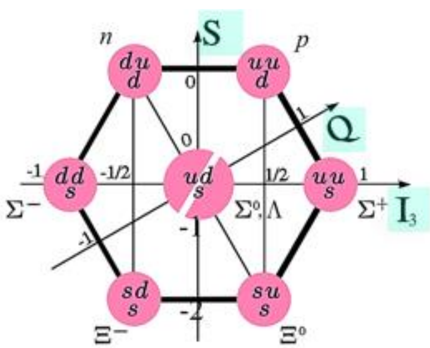
Unitarity Partners (?)

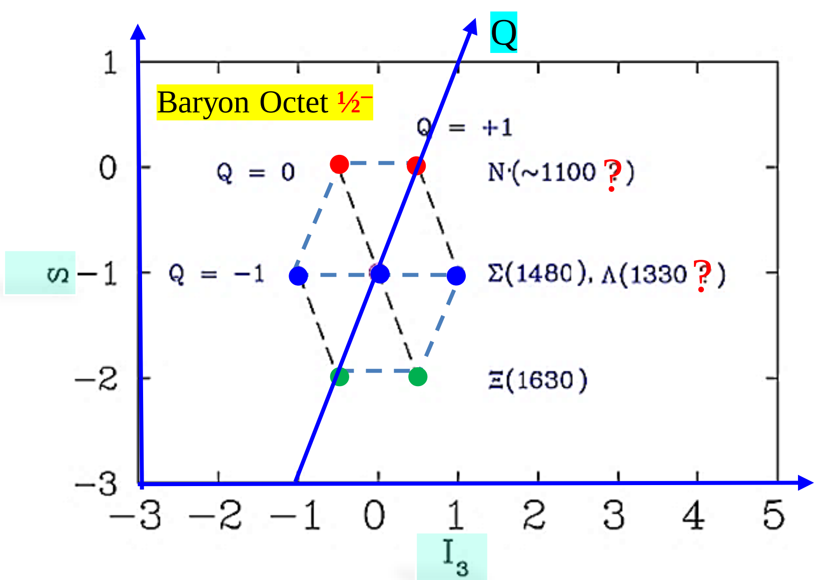
Ya. Azimov, R. Arndt, IIS, R. Workman, Phys Rev C **68**, 045204 (**2003**)

8 – S wave Multiplets

- If $\overline{10}$ is predicted to be $1/2^+$ (P-wave)
  Where is ground (S-wave) state ($1/2^-$) ?
- If this state is analogue to 10,
  then its intrinsic structure must be different,
  & its flavor structure must be different as well
  could be 8.
- There is no prediction of $1/2^-$ in ChSA
  (no predictions for negative parity @ all).

Baryon Octet ½⁺

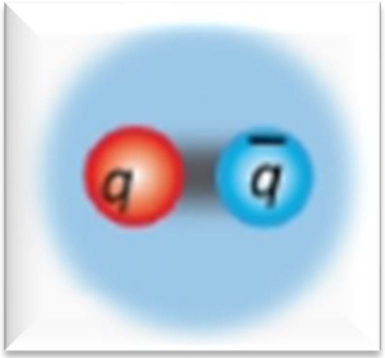




$$M = a_0 + a_1 Y + a_2 \left[I(I+1) - \frac{1}{4} Y^2 \right]$$

- Mixing be able to shift some masses for Gell-Mann-Okubo mass formula.

Strange Meson Spectroscopy

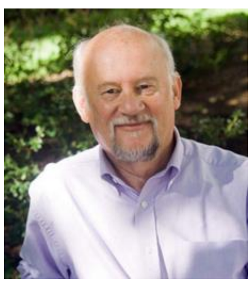


The di-quark or meson-baryon puzzle: Why is the quark-quark interaction just enough weaker than the quark-anti-quark interaction so that di-quarks near the meson mass are not observed, but three-quark systems have masses comparable to those of mesons?

Harry Lipkin, **1973**

For the region below 1 GeV, the debate centers on whether the phenomena are truly resonant or driven by attractive t-channel exchanges, and if the former, whether they are molecules or qq–anti-q-anti-q.

Frank Close, **2007**



QCD predicts there should be a far richer spectrum, with states made predominantly of glue, we call glueballs, tetra-quark states made of two quarks and two anti-quarks... For almost forty years we have been searching for these additional states. Indeed, we may well have observed some of these, but there is little certainty of what has been found.

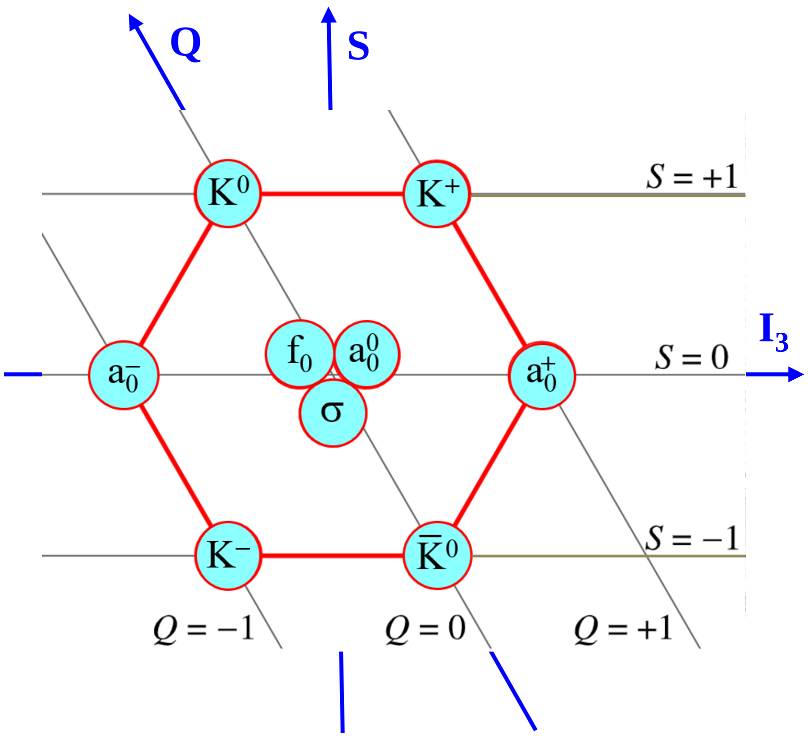
Michael Pennington, **2015**

A simple picture for both mesons and baryons is inconsistent with any version of relativistic field theory, where one can not exclude presence of an arbitrary number of virtual quark-anti-quark pairs and/or gluons. Therefore, adequate description of any hadron should use a Fock column, where lines correspond to particular configurations (but with the same ``global'' quantum numbers, like I, J, P, C, and so on).

Yakov Azimov, **2015**

Scalar Meson Nonet

SU(3): $J^{PC} = 0^{++}$ *Nonet*

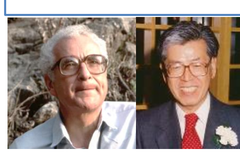


- ***Four*** states called *κ(700).*
- PDG: *still need further confirmation*.
- allows determination of all *four* states.

$$M = a_0 + a_1 Y + a_2 \left[I(I+1) - \frac{1}{4} Y^2 \right]$$

I *– isospin,* ***Y*** *– strangeness (hypercharge),* a_i *– free prmts.*

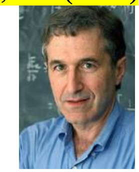
- This phenomenological formula works with accuracy of 5%.



- Mixing be able to shift some masses for *Gell-Mann-Okubo mass* formula.

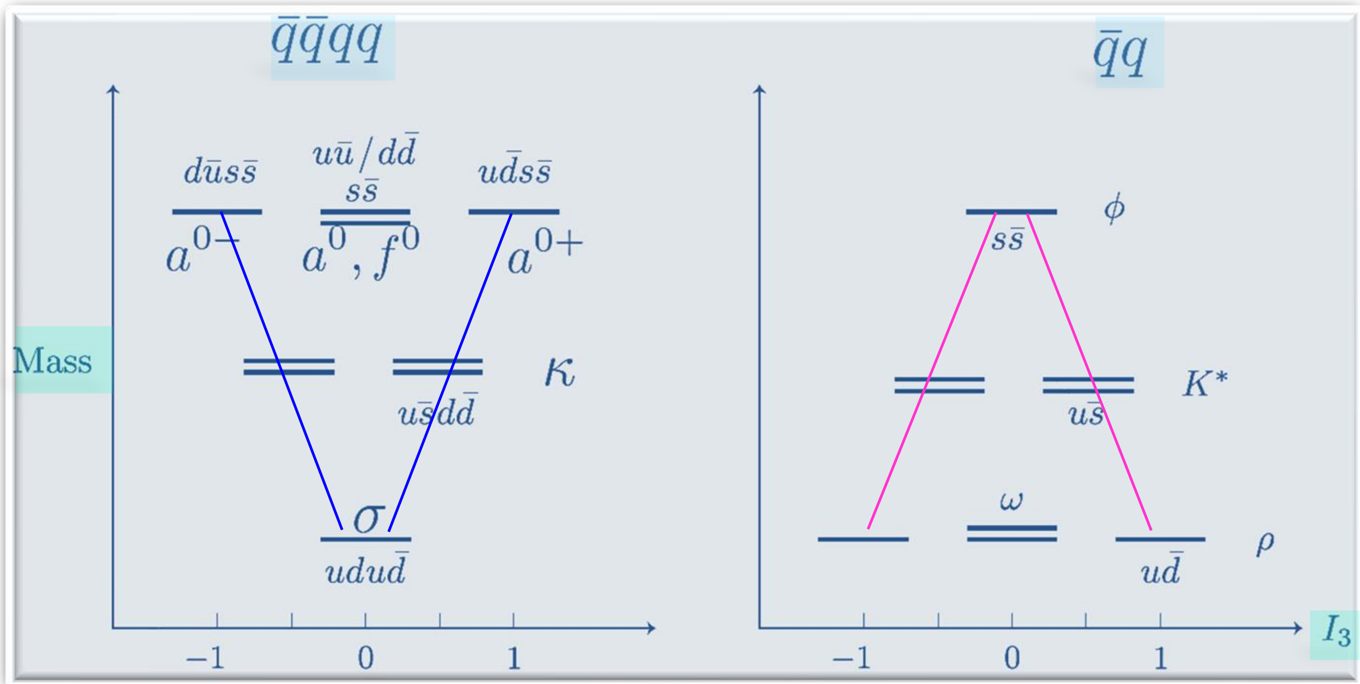
Scalars vs Vectors or Eyewitness of 4q Exotics ?

R.J. Jaffe, Phys Rev D **15**, 267 (1977)
arXiv: 0001123 [hep-ph]
Prog Theor Phys Suppl **168**, 127 (2007)



Inverted mass hierarchy tetraquarks
Scalar Mesons

Ordinary meson states
Vector Mesons



- Very different mass *hierarchy*.
- Possibly suggesting *4q tetraquark*.
- Structure of ***scalar*** mesons.

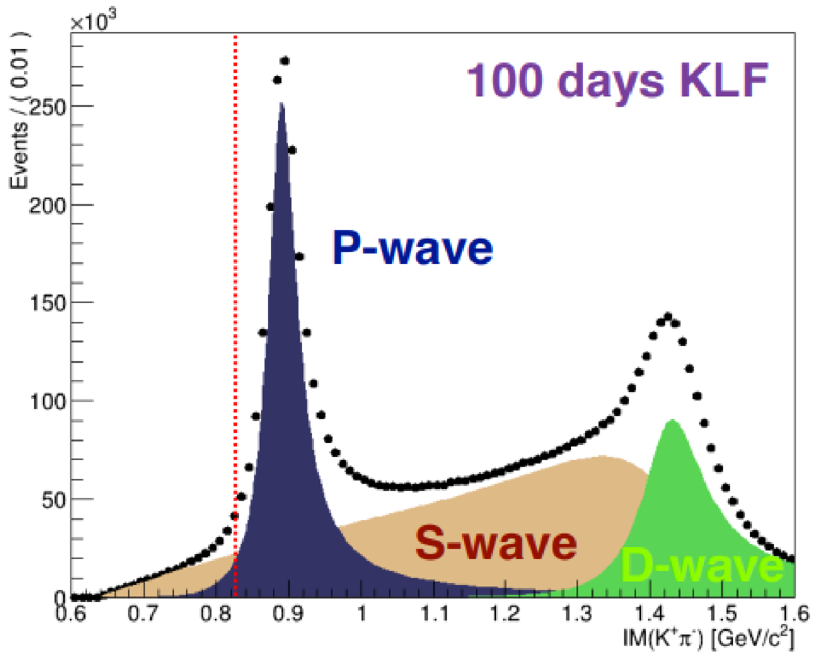
- *Certainly, there is no clear distinction between 4q & ``meson molecule'' categories.*

"I like the conclusion that the a_0 is a multi quark state." Courtesy of Bob Jaffe, 2022

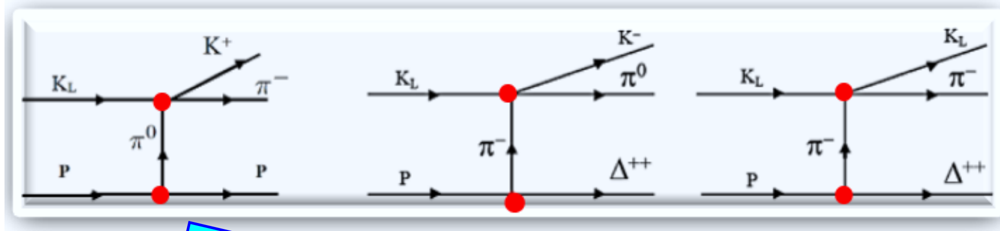
Strange Meson Spectroscopy

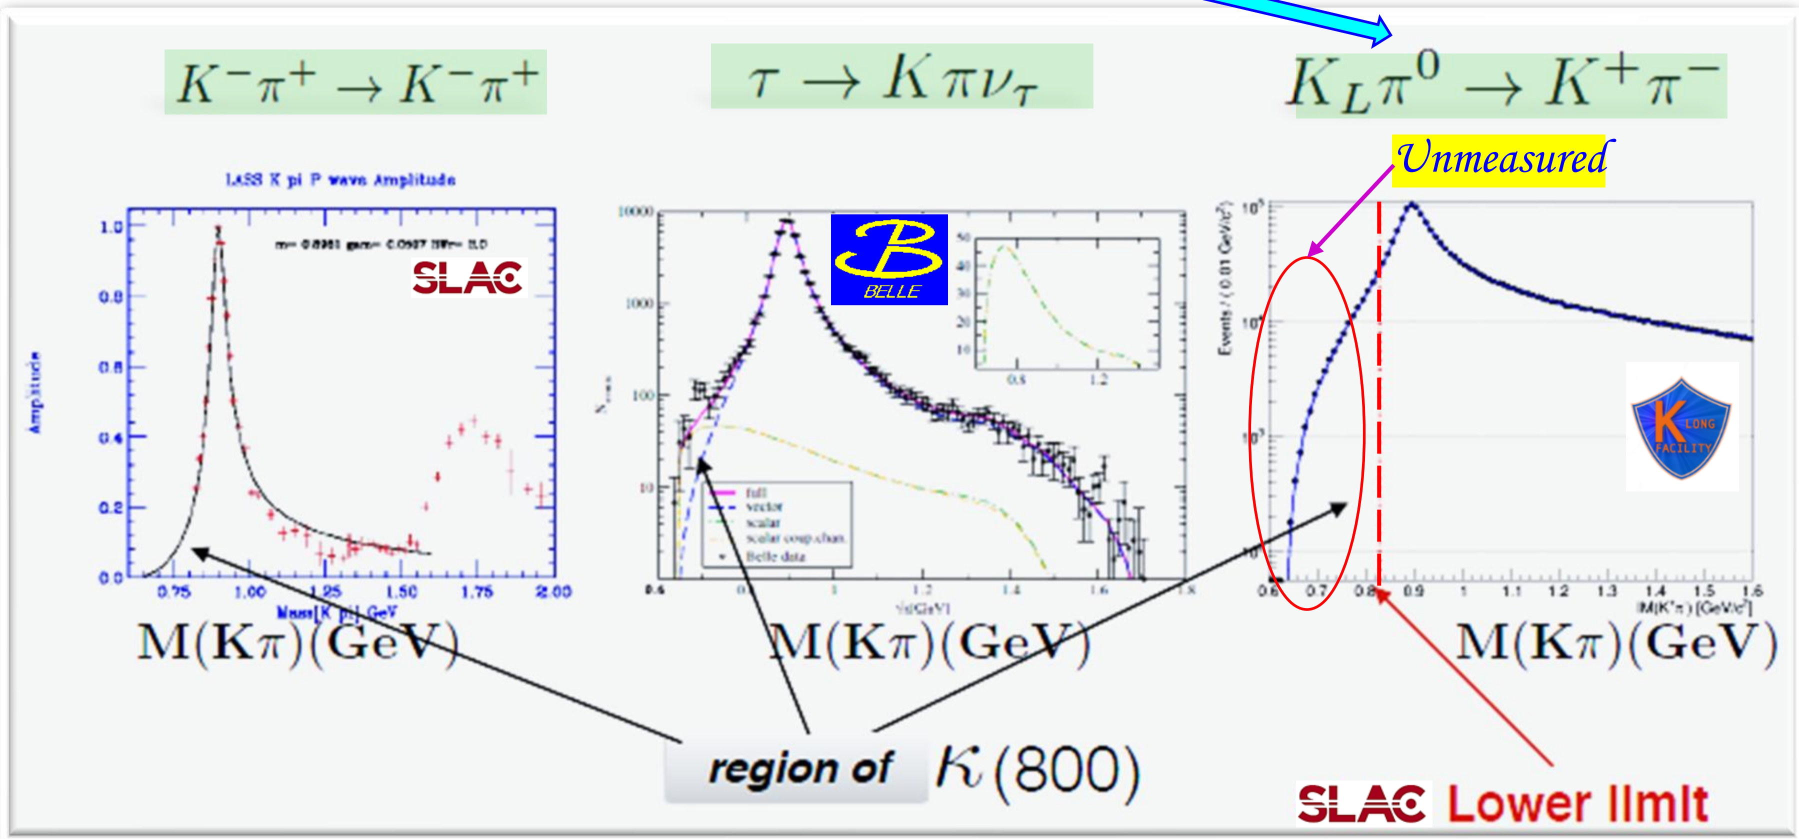
- Most knowledge of *kaon spectrum* comes from *older* kaon beam experiments.
  - More recent insight from, *e.g.*, *PWA* of decays from *charm* quark hadrons.
- High-statistics KLF data gives additional insight.
  - Unique access to high *mass/spin* states.
  - Study of *scalar* $K\pi$ system.

$$K_L p \to K^{\pm}\pi^{\mp}p$$



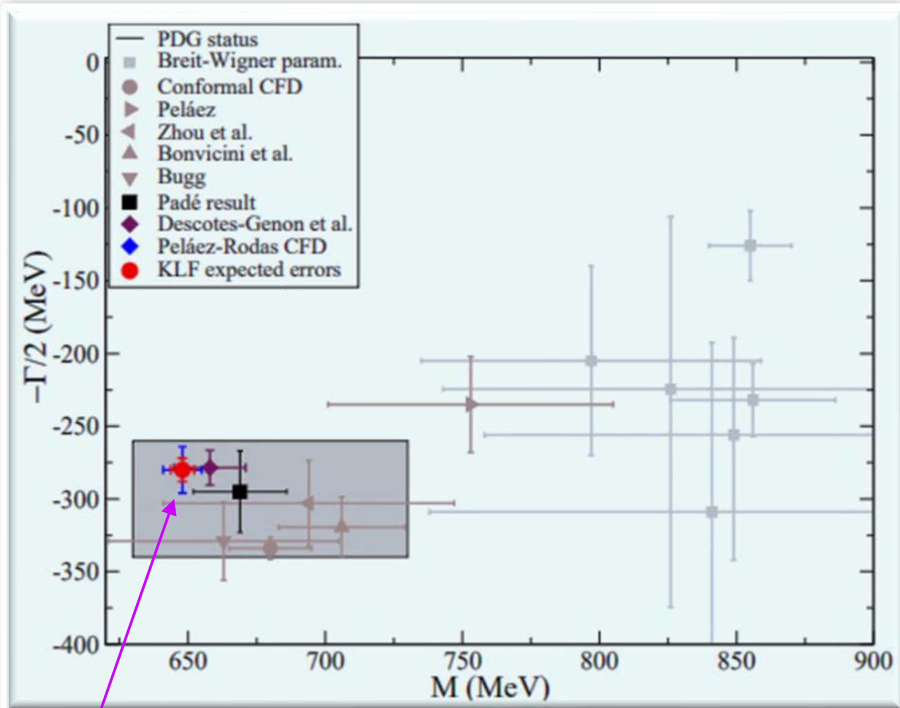
Proposed Measurements for $K\pi$ Scattering





Summary of Kπ Spectroscopy

Money Plot



100 days

- **Roy-Steiner** dispersion approach
  $M - i\Gamma/2 = (648 \pm 4) - i(280 \pm 8)$ MeV

J.R. Pelaez *et al* Phys Rev D **93**, 074025 (**2016**)

- [KLF] will have very significant *impact* on our knowledge on *Kπ scattering amplitudes*.
- It will certainly improve still conflictive determination of *heavy K*'s parameters*.
- It will help to settle tension between phenomenological determination of *scattering lengths* from data vs *ChPT* & *LQCD*.
- For *K*(700)*, it will reduce:
  - *uncertainties* in *mass* by factor of *two* &
  - *uncertainties* in *width* by factor of *five*.
- It will help to clarify debated of its *existence*, &, therefore, long standing problem of existence of *scalar* meson *nonet*.

Where We are Going

Beam Time Approved

- Expected cornucopia of differential cross sections of different reactions with LH_2 & below W = *2.5* GeV for *100* days of beam time:

For $d\sigma/d\Omega$

Reaction	Statistics (events)
$K_L p \to K_S p$	2.7M
$K_L p \to \pi^+ \Lambda$	7M
$K_L p \to K^+ \Xi^0$	2M
$K_L p \to K^+ n$	60M
$K_L p \to K^- \pi^+ p$	7M

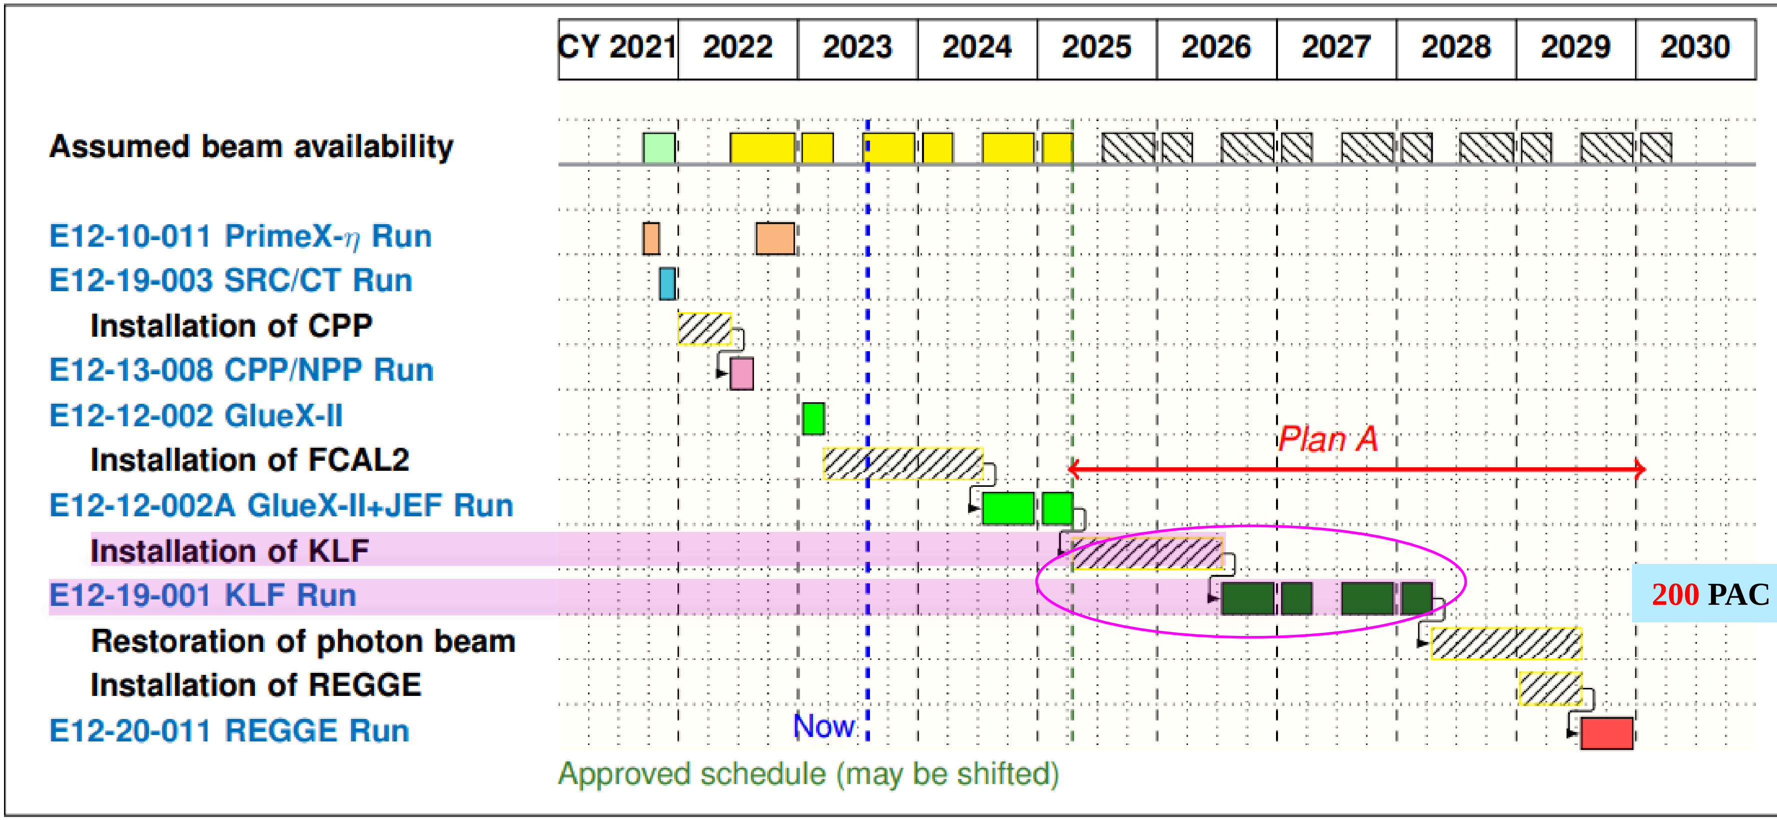
For ***P*****,** statistics is 0.2M

- There are no data on ``*neutron*'' targets &, for this reason, it is hard to make realistic estimate of statistics for $K_L n$ reactions.
  If we assume similar statistics as on ``*proton*'' target, full program will be completed after running *100* days with LH_2 & *100* days with LD_2 *cryo* targets.

- Expected systematics is *10*% or less.

Jefferson Lab *Hall D Tentative Schedule*

Hall D running schedule: outlook



- Assuming 31 weeks/year for Hall D running in 2024/07-2025/03 and 30 weeks afterwards
- Assuming KLF compatibility with MOLLER, and timing budgeting for KLF and REGGE
- Assuming timely construction of JEF,KLF,REGGE

歡迎
請進來

KLF Experiment was approved in **08/20**.
ERR-I was approved in **08/23**,

- Our goal is
  - To setup *KL Facility* @ Jefferson Lab
  - To do measurements which bring *new physics*.

- Jefferson Lab K Long Facility would advance *Hyperon Spectroscopy* & study of *strangeness* in nuclear & hadronic physics.
  We may have cornucopia of many missing/new strange states.
  To complete ***SU(3)***$_F$ *multiplets*, one needs no less than 48 Λ^*, 38 Σ^*, 61 Ξ^*, & 31 Ω^*.

- Discovering of ``*missing*" *hyperon states* would assist in advance our understanding of formation of *baryons* from *quarks* & *gluons* *microseconds* (**!**) after *Big Bang*.
  Our expectation is to get **1** messed/new *hyperon* per **1** day.

- In *Strange Meson Spectroscopy* ***PWA*** will allow to determine excited *K** states including *scalar* *K*(700)* states.

非常感謝

A Bit of History

PHYSICAL REVIEW VOLUME 138, NUMBER 5B 7 JUNE 1965

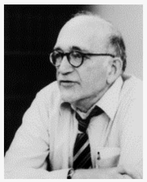
First paper on subject

Photoproduction of Neutral K Mesons*

CP-violation (1964)
Hot topic!

S. D. DRELL AND M. JACOB†
Stanford Linear Accelerator Center, Stanford University, Stanford, California

(Received 6 January 1965)



Photoproduction of a neutral K-meson beam at high energies from hydrogen is computed in terms of a K^* vector-meson exchange mechanism corrected for final-state interactions. The results are very encouraging for the intensity of high-energy K_2 beams at high-energy electron accelerators. A typical magnitude is 20 μb/sr for a lower limit of the K^0 photoproduction differential cross section, at a laboratory peak angle of 2°, for 15-BeV incident photons.

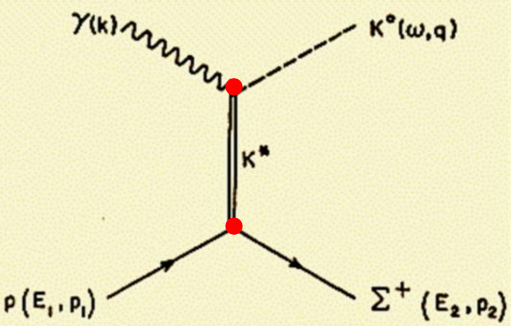


FIG. 1. K^* exchange in photoproduction.

Our motivation in carrying out this calculation is to emphasize the strong suggestion that an intense "healthy" K_2 beam will emerge from high-energy electron accelerators (SLAC in particular) and will be available for detailed experimental studies.

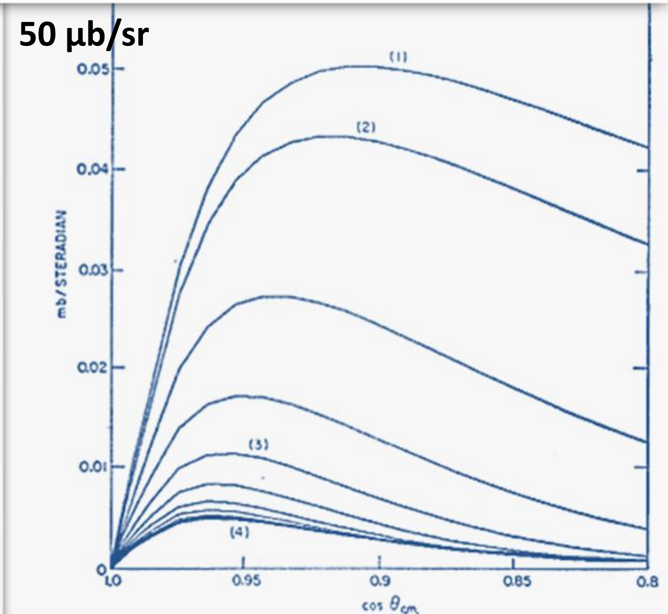

FIG. 3. Center-of-mass differential cross section at 10 BeV. Curve (1) gives the Born approximation. Curve (2) is obtained after subtraction of the $j=\frac{1}{2}$ partial wave. Curves (3) and (4) are respectively obtained after the $j=\frac{1}{2}, \frac{3}{2}, \frac{5}{2}, \frac{7}{2}$, and all partial waves have been corrected for absorption in final state. The results shown as directly obtained from and drawn by the computer.

Courtesy of Mike Albrow, KL2016

The possibility that useful K_L beam could be made @ electron synchrotron by photoproduction was being considered, & *1965* prediction for SLAC by Drell & Jacob was optimistic.

Study photoproduction as means of making clean K0 beams & their decays & later, interactions.

From: Mike Albrow **Aug 29, 2020**
To: Igor Strakovsky
Dear Igor, That is excellent news, thank you for letting me know.
In one of those strange coincidences, my professor at Manchester who had the idea for our K0 photoproduction experiments and led the program, Paul Murphy (Manchester Univ.) died on Wednesday Aug 26. He was 89.
I had told him about your plans, he was still interested. He would have been happy to know that 50 years later you are benefitting from his idea.
Best, Mike (I am doing well, thank you)
*PS: If your proposal was accepted on Aug **26**th let me know, it would be strange synchronicity!*

VOLUME 22, NUMBER 18 PHYSICAL REVIEW LETTERS 5 MAY 1969

PRODUCTION OF K_2^0 MESONS AND NEUTRONS BY 10- AND 16-GeV ELECTRONS ON BERYLLIUM*

A. D. Brody, W. B. Johnson, D. W. G. S. Leith, G. Loew, J. S. Loos, G. Luste, R. Miller, K. Moriyasu, B. C. Shen, W. M. Smart, and R. Yamartino

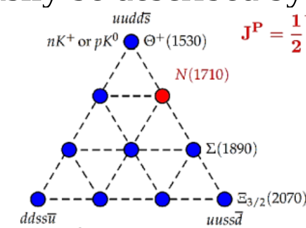
(Received 13 March 1969)

Systematics of particle-anti-particle processes through intrinsic property of K-longs.

KLF Potential

- For complete experiment, one can use *FROST* hydrogen/deuterium *polarized* target.
- Further potential exists to search for possible *exotic* baryonic states, ***5q***, that cannot easily be described by usual three-valence-quark structure.



- Similarly, scattering of kaons from nuclear targets could be favorable method to measure matter form factor (&, therefore, *neutron skin*) of heavy nuclei, with different & potentially smaller systematics than other probes.
- High quality *neutron beam* will allow to study $np \to K^+X$ & $np \to \pi^+X$.
- *Short Range Correlation* (***SRC***) experiments are doable as well.
- Study *Primakoff* reaction using *KL* probe & nuclear targets is possible via $K^{*0}(892)$ decay into $K^0\gamma$,

BR = 0.25 ± 0.20%.

- Physics potential connected with studies of ***CP***-violating decays of *KL* as, *e.g*, $K_L^0 \to \pi^0\nu\bar{\nu}$ is very appealing.
- High flux *KL* beam allows first measurement of *KL β-decay*, $K_L^0 \to K^+e^-\bar{\nu}_e$
SM postulated to preserve conservation laws in *β*-decay
Pauli: ``*I created a monster*.”

BR ~ 4×10^{-9}
