# Backgrounds at KLF

Mikhail Bashkanov

# Possible Backgrounds

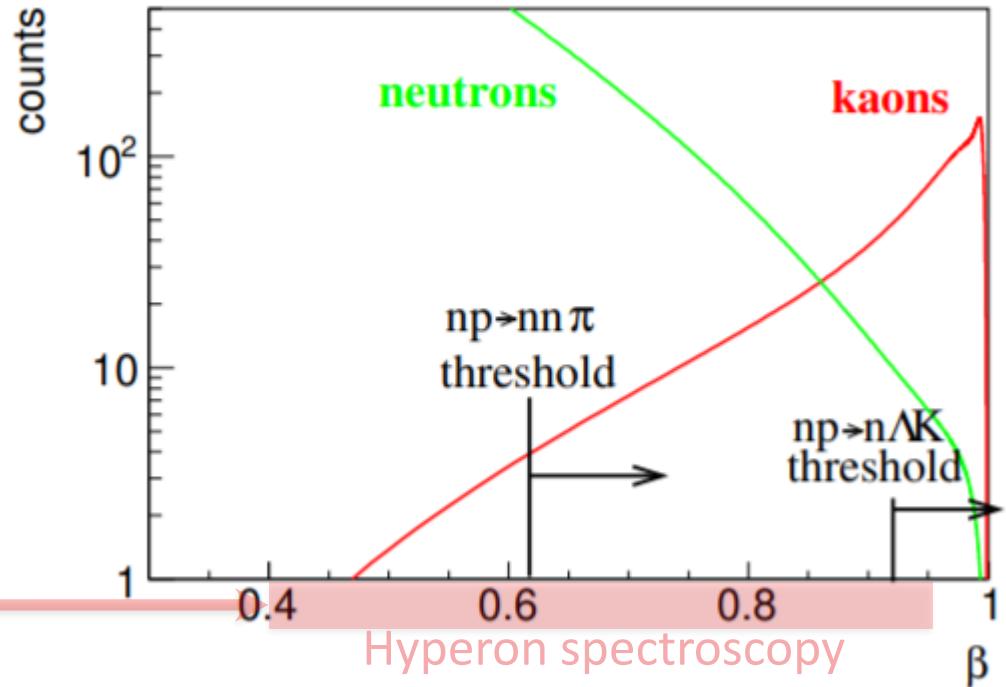

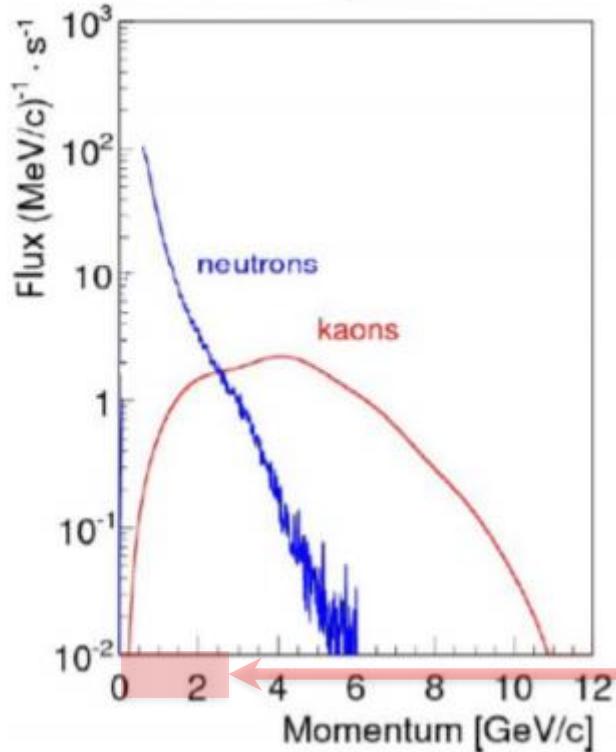

- Photons:
  - Absorbed in Tungsten
  - $v = c$
  - Small x-section
- Neutrons:
  - $v_n \ll v_{K_L}$
  - Different kinematics

94% of neutrons associated with  $T < 300\text{MeV}$

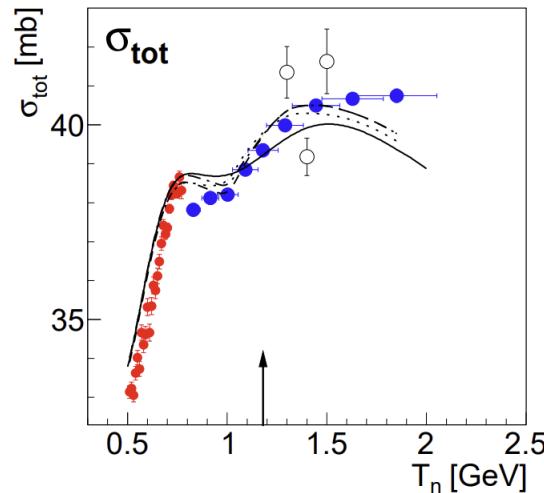

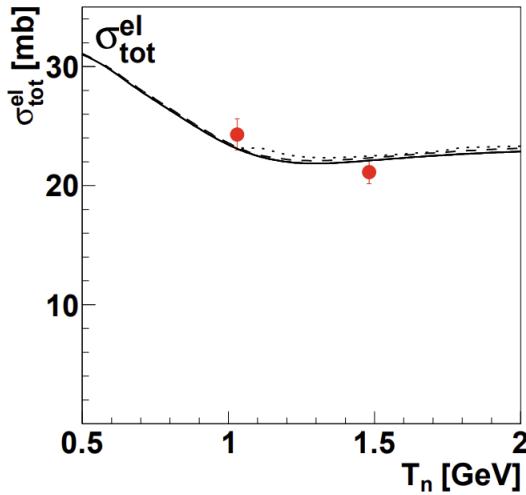

# Neutrons

# Neutron Background

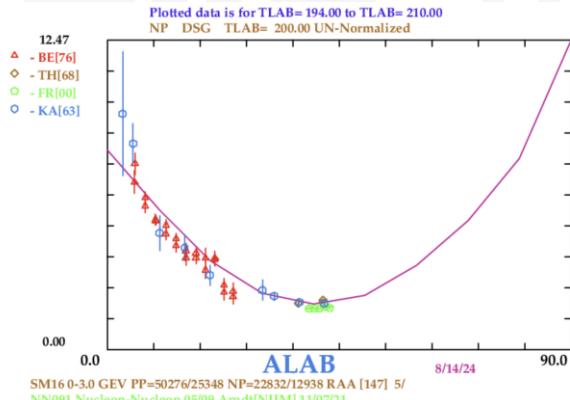

- $E_n > 1.6 \text{ GeV}$  (strangeness threshold)  $\sim 1\%$  of neutron flux
- $0.3 < E_n < 1.6 \text{ GeV}$  (above pion threshold)  $\sim 5\%$  of neutron flux
- $E_n < 0.3 \text{ GeV}$   $\sim 94\%$  of neutron flux – do not contribute

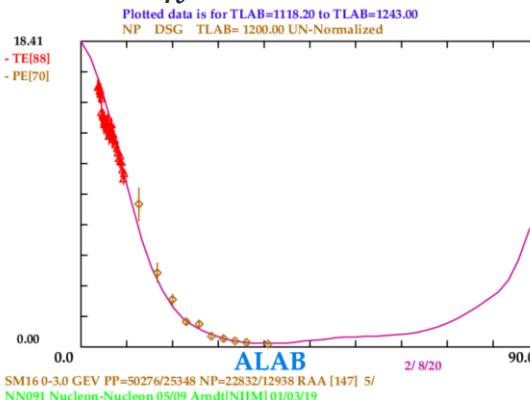

# Neutron Cross-Sections

$E_n = 0.2 \text{ GeV}$

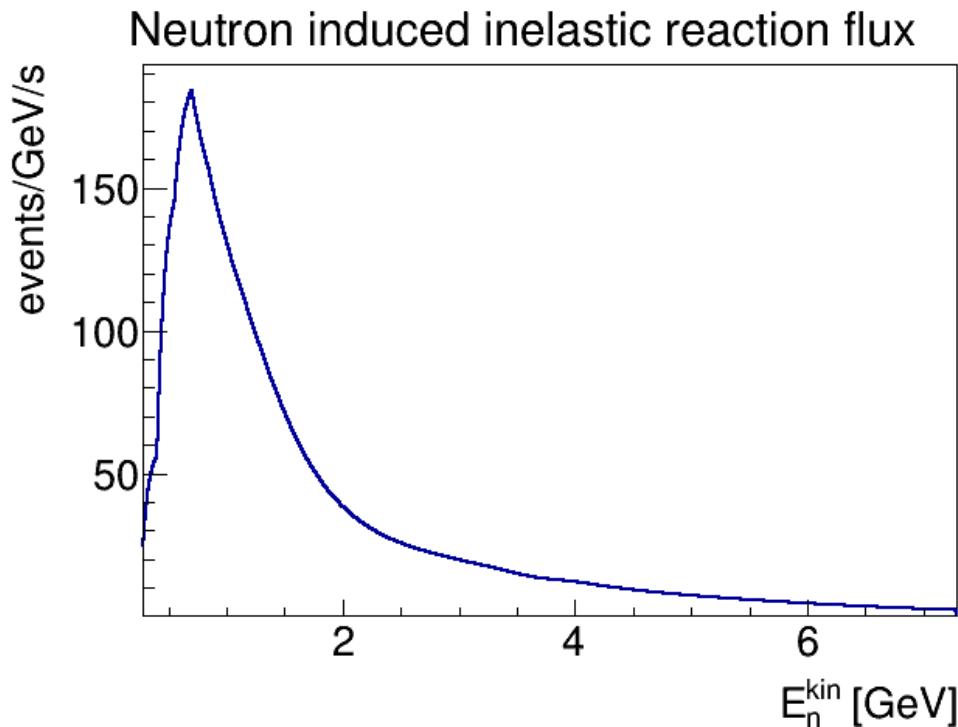

$E_n = 1.25 \text{ GeV}$

- Elastic cross-section forward-backward peaked
- Either beampipe or at 90 deg with  $E \sim 0$

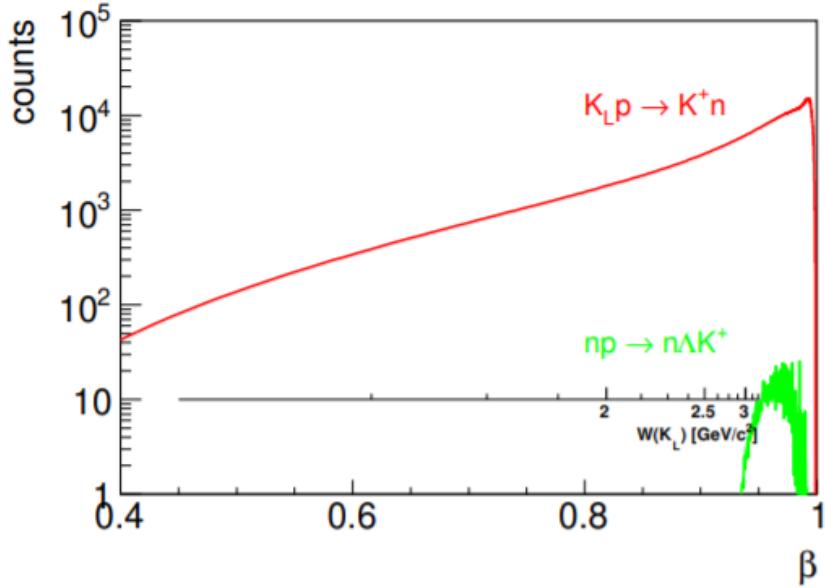

# Neutron Reaction yield

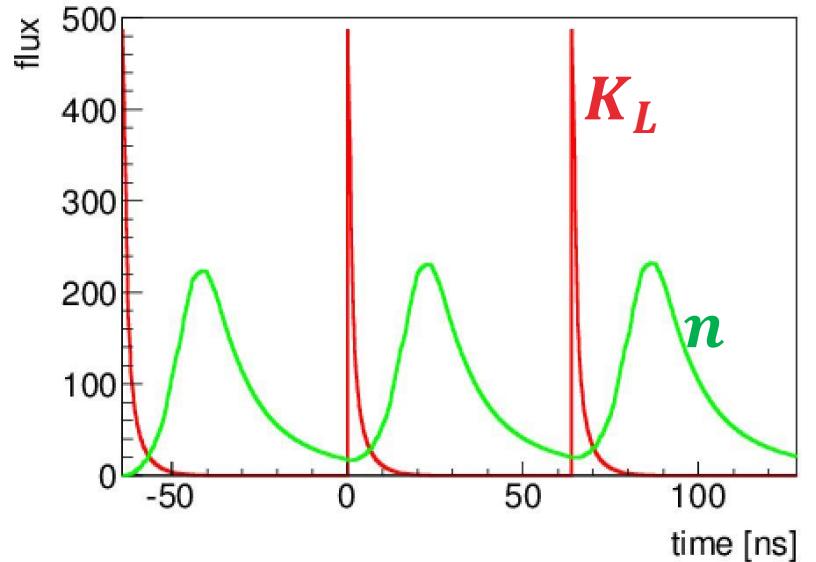

- Neutron-induced reaction rate: **233 ev/s**

# Neutron Background

## Reaction yield

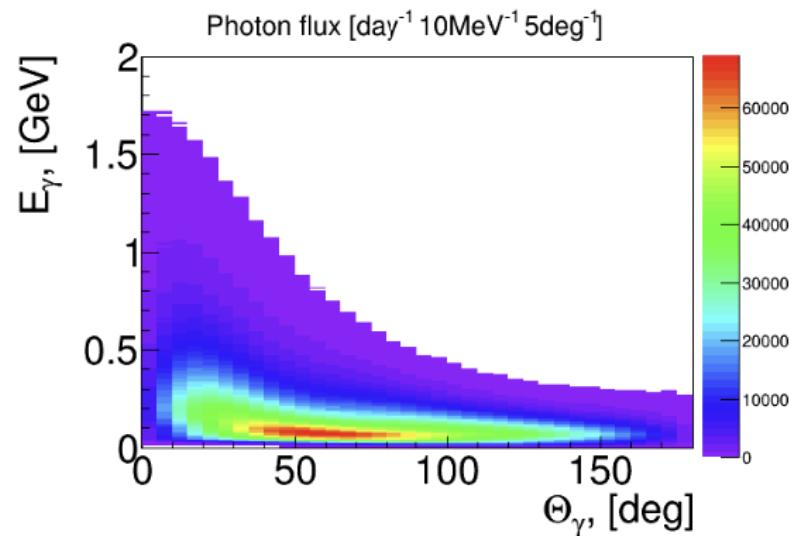

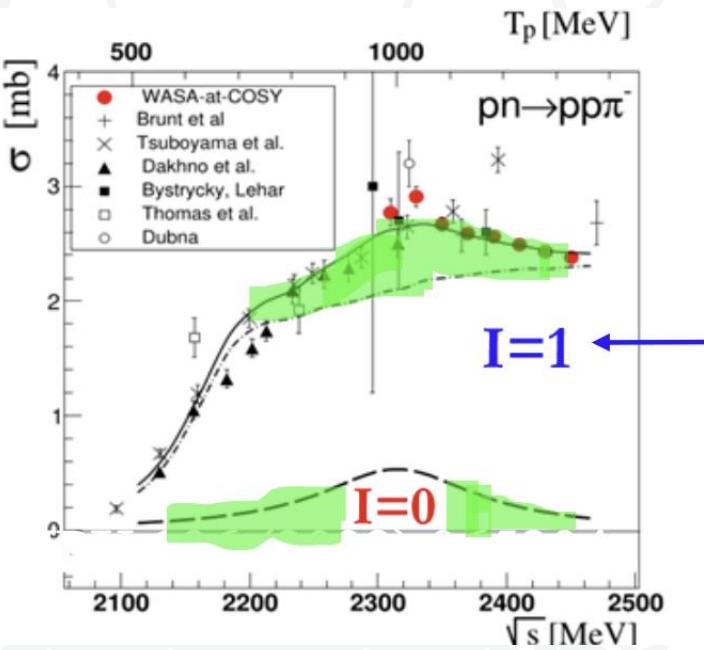

## Bunch time structure

- Neutron-induced reactions are not an issue for the main program

# Useful Neutrons: Calibration

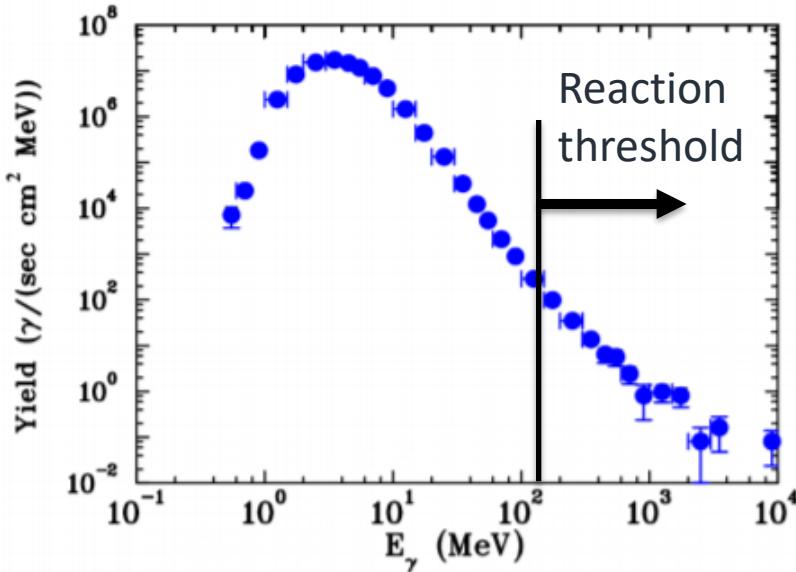

- Neutron-induced reactions are isospin  $I=1$  dominated
- Can be used for calibration  $np \rightarrow np\pi^0$
- $\sim 24M$   $\gamma$ 's from neutron-induced  $\pi^0$  production per day
- Neutron-induced reactions have high scientific interest!

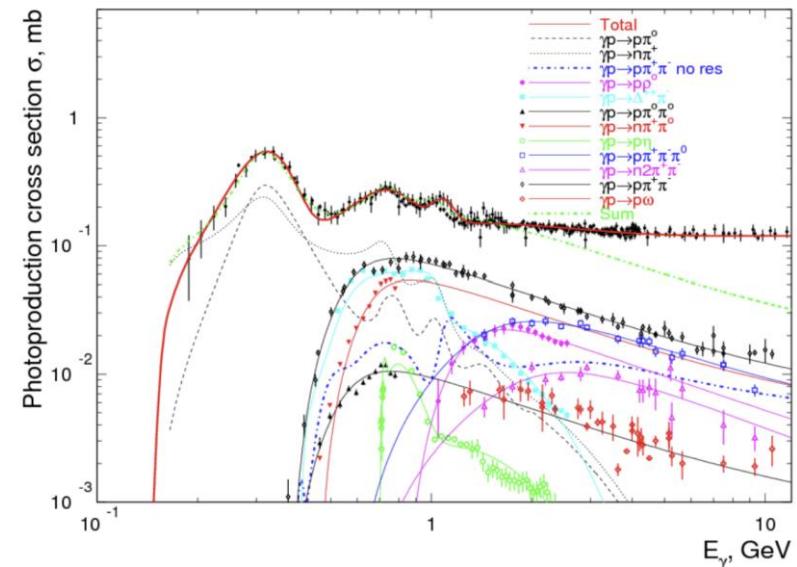

# Photons

# Photon background

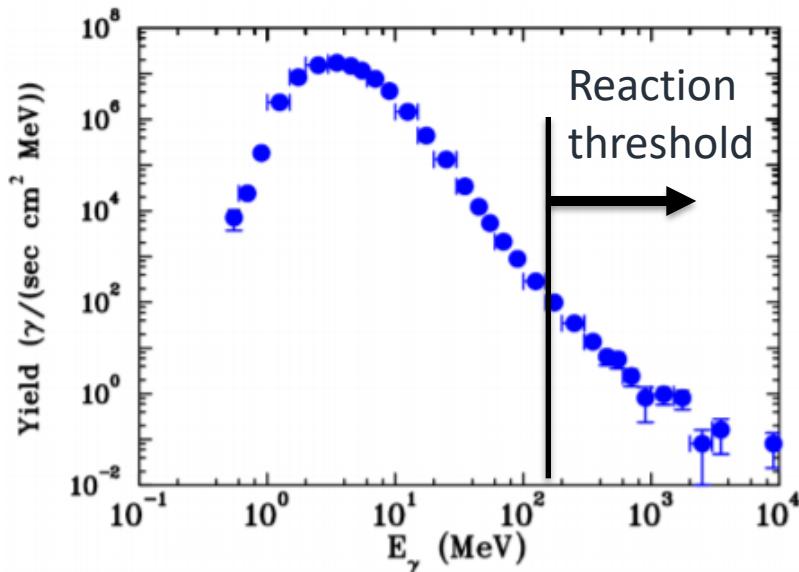

Photon flux at LH2/LD2

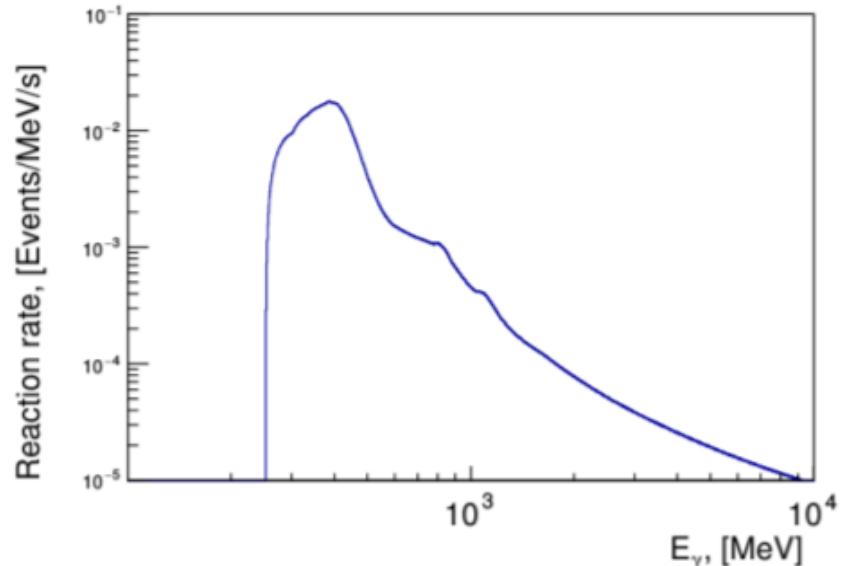

Photoinduced reaction rate

- Photoinduced reaction rate  $< 4\text{Hz}$

# Photon background

Photon flux at LH2/LD2

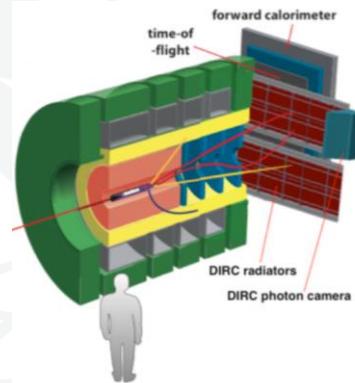

Photoinduced reaction rate

- Photoinduced reaction rate  $< 4\text{Hz}$
- Photoproduction reactions are not an issue for the main program

# Cosmics

# Cosmic muon background

- Cosmic rate induced rate:  $\sim 500 \text{ ev/s}$
- Cosmic rays are not an issue for the main program

# Total budget

Reactions	Rate [kHz]
$K_L$ –induced	1.0
$n$ –induced	0.4
$\gamma$ –induced	0.004
cosmics	0.5
<b>Total</b>	<b>~2.0</b>

# Conclusion

- Background conditions at KLF are very mild
- No physical background problems at reconstruction level. (from neutron- gamma- induced production in cryogenic target)

# Neutron Background
