

No Reaction Filter. Reconstruction of $K_L + p \rightarrow K^+ + n$ at $p_{K\text{-Long}} = (0.23 ; 0.65)$ GeV/c.

KLGenerator_hddm_V3 -M200000 -Fgenerated.root -Ekaon:plain:0.05:0.32 -Rkl1

- The yield of neutrons is ~40,000 out of 200,000 generated $K_L + p$ reactions (~20%).
- Reconstruction Efficiency in the 5q-region is of 45%.

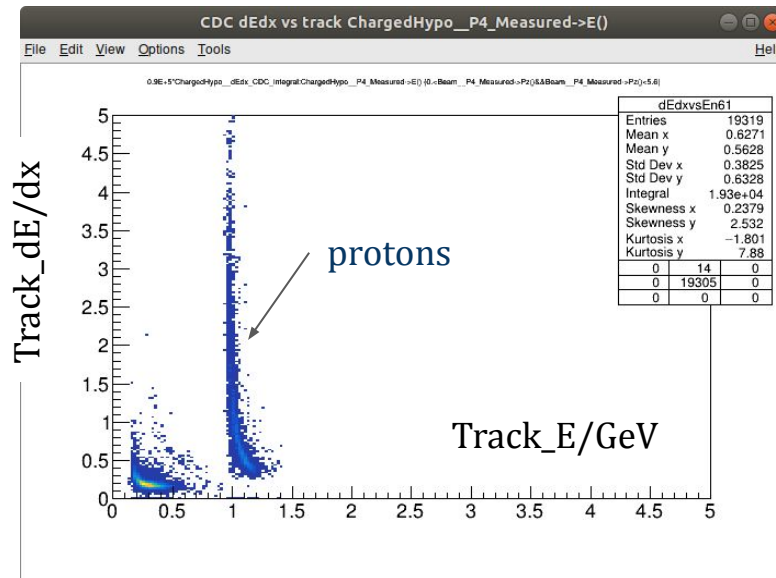

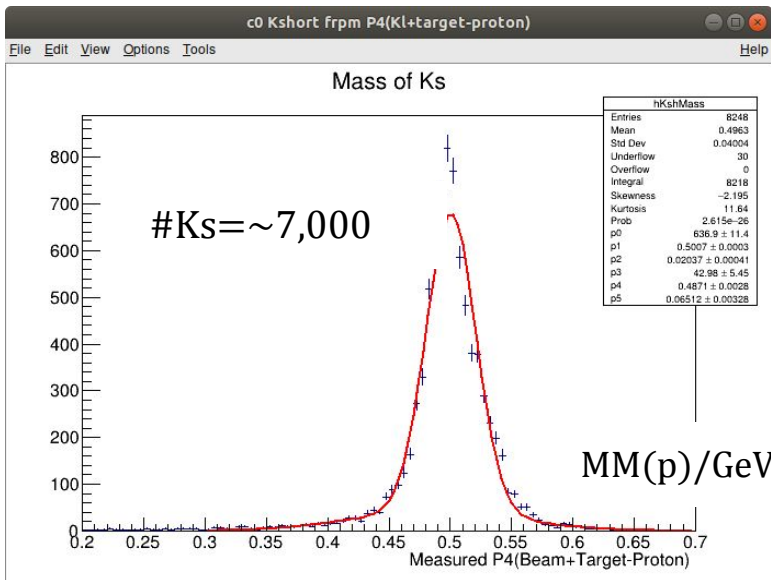

Why only 100,000 out of 200,000 generated $K_L + p \rightarrow K^+ + n$ in ROOT tree?

Reaction Filter. Beam profiles and Reconstruction Efficiency.

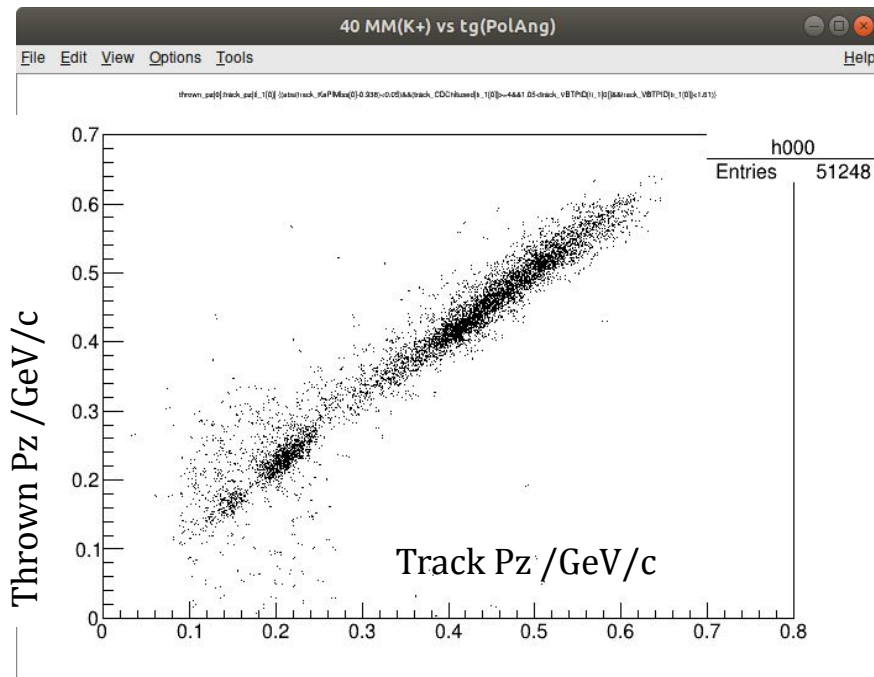

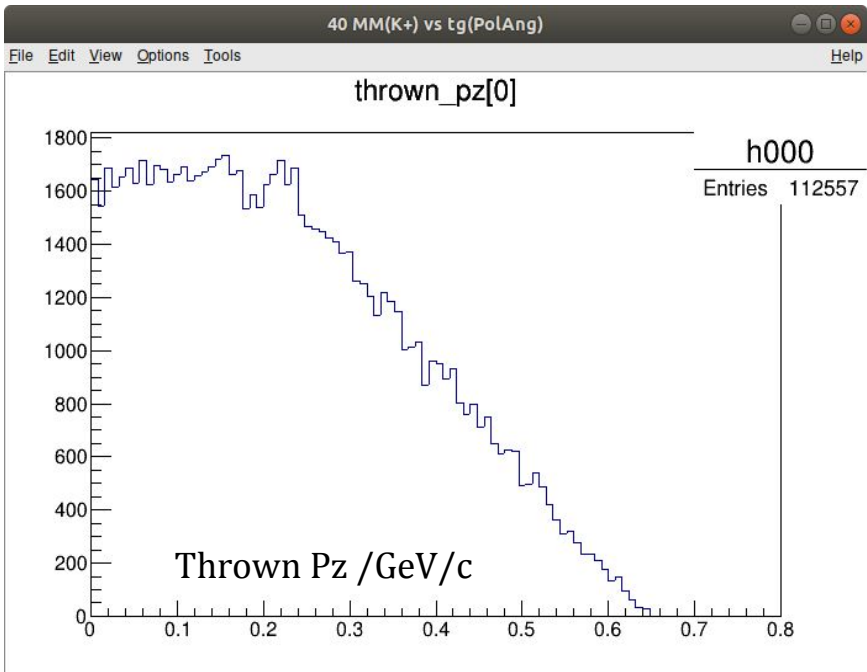

- About **20,000 events in the Tree** after Reaction Filter ($\sim 10\%$).
- The **yield of K-shorts is of 7,000** out of 200,000 generated events ($\sim 3.5\%$).
- **Reconstruction Efficiency** Histogram = Divide(Right_Hist : Left_Hist). **Next slide.**

Reaction Filter. Reconstruction Efficiency.

- In the 5q-region (0.44 GeV/c) Reconstruction Efficiency is of 40%.
- The yield of K-shorts is of 3.5% of 200,000 generated.

Why a structure in track_pz shows up?

Generated $K^+ + n$ final state at $p_{KLong} = (0.24:10.64)$
 GeV/c
 Before Oct 29.

- Reconstruction efficiency drops at $p_{Klong} < 0.32$ GeV/c.

Generated $K^+ + n$ final state at $p_{KLong} = (0.24:0.64)$ GeV/c After Oct 29.

- Reconstruction efficiency drops at $p_{Klong} < 0.55$ GeV/c.
- Looks like we have a higher beam momentum threshold !
- B field changed to higher in GEANT model ? Inner CDC layers are not included ?

$$p_{K\text{Long}} = (0.24:0.64) \text{ GeV/c}$$

MM(K⁺)

$$p_{K\text{Long}} = (0.24:0.54) \text{ GeV/c}$$
