## Temperature Calculations with Mathematica

Hovanes Egiyan

## Studies with KLCPS64 last week

- Study temperature in the absorber only using Mathematica.
- Check consistency with Tim's calculations with ANSYS
  - Tim calculated temperature for KLCPS64 with rectangular grid.
  - I calculated temperature for KLCPS64 with cylindrical grid with the same cooling model (cooling holes off-center 8cm in each direction).
  - The results for  $T_{max} = 205$  °C match within 5 °C.
- Checked rectangular grid in Mathematica (without cooling holes).
  - $T_{max}$  seems to be dependent on the mesh size (currently 2mm).
    - My cylindrical grid for now provides better sensitivity (x10) at the location of the triangular wedge.
  - ullet The results for rectangular and cylindrical model in Mathematica match within 15  $^{
    m 0C}$ .
- I noticed an x-asymmetry in the solutions for temperature around triangular wedge when solving in cylindrical coordinate system.
  - This is related to how  $2\pi$  periodic boundary conditions are imposed in the cylindrical coordinates.
  - It apparently can cause about 10 °C difference in T<sub>max</sub>, based on my tests.
    - After fixing the asymmetry  $T_{max}$  seems to go up by 10  ${}^{0}C$
  - I will switch to  $\phi \in [-\pi/2, 3\pi/2]$  range and stitch the solution at those limits instead of  $\phi \in [-\pi, +\pi]$ .
    - It would be great if Pavel can provide cylindrical grid with those limits.

## Temperatures from Pavel's Tests

- I looked at some of the tests that Pavel did with KLCPS64 model to estimate the temperature in the absorber.
  - $\pm 10\%$  B-field and  $\sigma^{(x,y)}_{beam}$  widths are kind of extreme conditions that are highly unlikely to occur during running.
- Used water temperature T<sub>water</sub>=40 <sup>o</sup>C with cooling holes offset at 7cm in each direction.
- All tests were solved using similar conditions and parameters for consistency.
- None of the tests produces high maximum temperature or requires high temperature at the water boundary.
  - The highest T<sub>max</sub> so far happens with -1mrad angle in Y and 110% B-field, when the beam hits the forward corner of the absorber.
- The current vertical beam position may not be optimal for the B-field.
  - Can be addressed at a later stage when B-field is better defined
- There are other tests that Pavel did that I have not looked at yet.

Test Name	Hot Spot Location Section	R <sub>max</sub> (cm)	φ <sub>max</sub> (deg)	Z <sub>max</sub> (cm)	T <sub>max</sub> (°C)	T <sub>holes</sub> (°C)	Comment
Nominal $(\sigma^{(x,y)}_{beam} = 1 \text{ mm})$	Triangular	0.3	70	8	240 ±25	55	x-asymmetry
$\sigma^{(x,y)}_{beam}$ = 100 $\mu m$	Triangular	0.0	N/A	44	240 ±25	65	No asymmetry
90% B-field	Rectangular	0.2	90	59	230 ±25	60	x-asymmetry
110% B-field	Triangular	0.2	70	8	305 ±25	70	x-asymmetry
-1mm shift in Y	Triangular	0.2	70	8	255 ±25	65	x-asymmetry
+1mm shift in Y	Rectangular	0.1	90	57	180 ±25	60	x-asymmetry
-1mrad angle in Y	Triangular	0.15	70	8	335 ±25	70	x-asymmetry
+1mrad angle in Y	Rectangular	0.2	90	59	240 ±25	60	x-asymmetry
