Recommendations

PAC 48 SUMMARY OF RECOMMENDATIONS								
Number	Contact Person	Title	Hall	Days Req'd	Days Awarded	Scientific Rating	PAC Decision	Topic
C12-18-005	M. Boer	Timelike Compton Scattering Off Transversely Polarized Proton	C	50			**C2**	4
C12-19-001	M. Amarian	Strange Hadron Spectroscopy with Secondary KL Beam in Hall D	D	200	200	A-	**Approved**	1

Title: Strange Hadron Spectroscopy with Secondary KL Beam in Hall D

Spokespersons: M. Amaryan (contact), M. Bashkanov, S. Dobbs, J. Ritman, J. Stevens, I. Strakovsky

Motivation: The spectroscopy of strange baryons and mesons, including their fundamental strong interactions, are the focus of this proposal. New and unique data can be obtained with an intense K_L beam aimed at a hydrogen/deuterium target, using the GlueX apparatus to detect final state particles.

Measurement and Feasibility: The proponents have answered all questions outlined in the PAC47 report. Substantial progress has been made on the issues of simulations: details on backgrounds and background reactions have been demonstrated, a demonstration of partial wave analysis for hyperon production was given. The proponents have demonstrated the measuring technique of missing mass reconstruction, allowing them to extend the measuring range both regarding small, four-momentum transfers and isospin decomposition. No show stoppers have been pointed out by the TAC.

Issues: The PAC strongly recommends that the collaboration intensify their cooperation on two issues. (1) Coordinated leadership must be established together with the host laboratory to address the various technical issues connected with the R&D efforts and construction of the K_L beam. (2) Continuous cooperation with JPAC and associated members is recommended for the development of tools to master the challenges connected with the clean extraction of $K\pi$ scattering, the identification of the exchange processes at small momentum transfers, and the amplitude analysis for Δ final states.

Summary: The future K_L facility will add a new physics reach to JLab, and the PAC is looking forward to see the idea being materialized, in conjunction with the plans for Hall D as spelled out in the 2019 White Paper. The collaboration should now devote all its energy to turn this challenging project into an experimental facility and in parallel prepare for a successful data analysis.

This happens because of strong support and dedicated efforts of the KLF Collaboration

5.7 K_L Momentum Determination and Beam Resolution

The mean lifetime of the K_L is 51.16 nsec ($c\tau = 15.3$ m) whereas the mean lifetime of the K^- is 12.38 nsec ($c\tau = 3.7$ m) [1]. For this reason, it is much easier to perform measurements of K_Lp scattering at low beam energies compared with K^-p scattering.

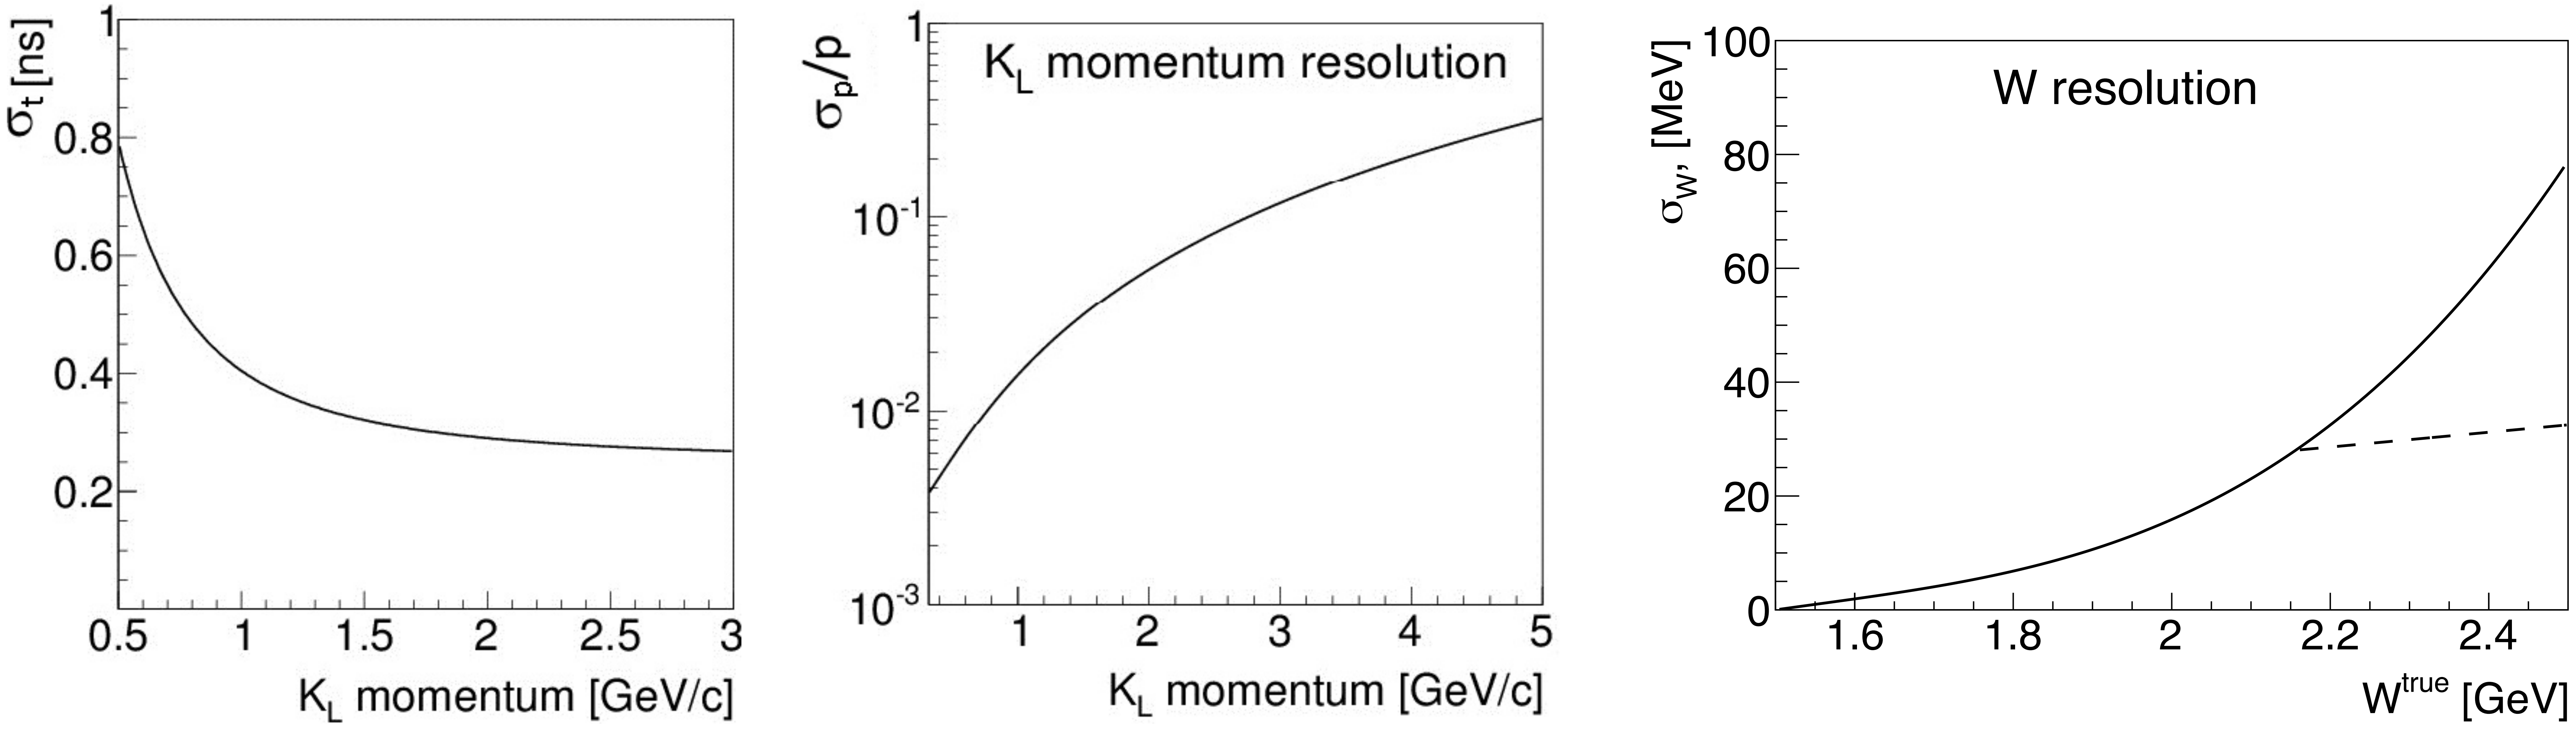

Figure 30: Left: Time resolution (σ_t) for K_L beam as a function of K_L-momentum. Middle: Momentum resolution (σ_p/p) as a function of momentum (note, log scale). Right: Energy resolution (σ_W) as a function of energy. The dashed line shows approximate W resolution from reconstruction of the final-state particles.

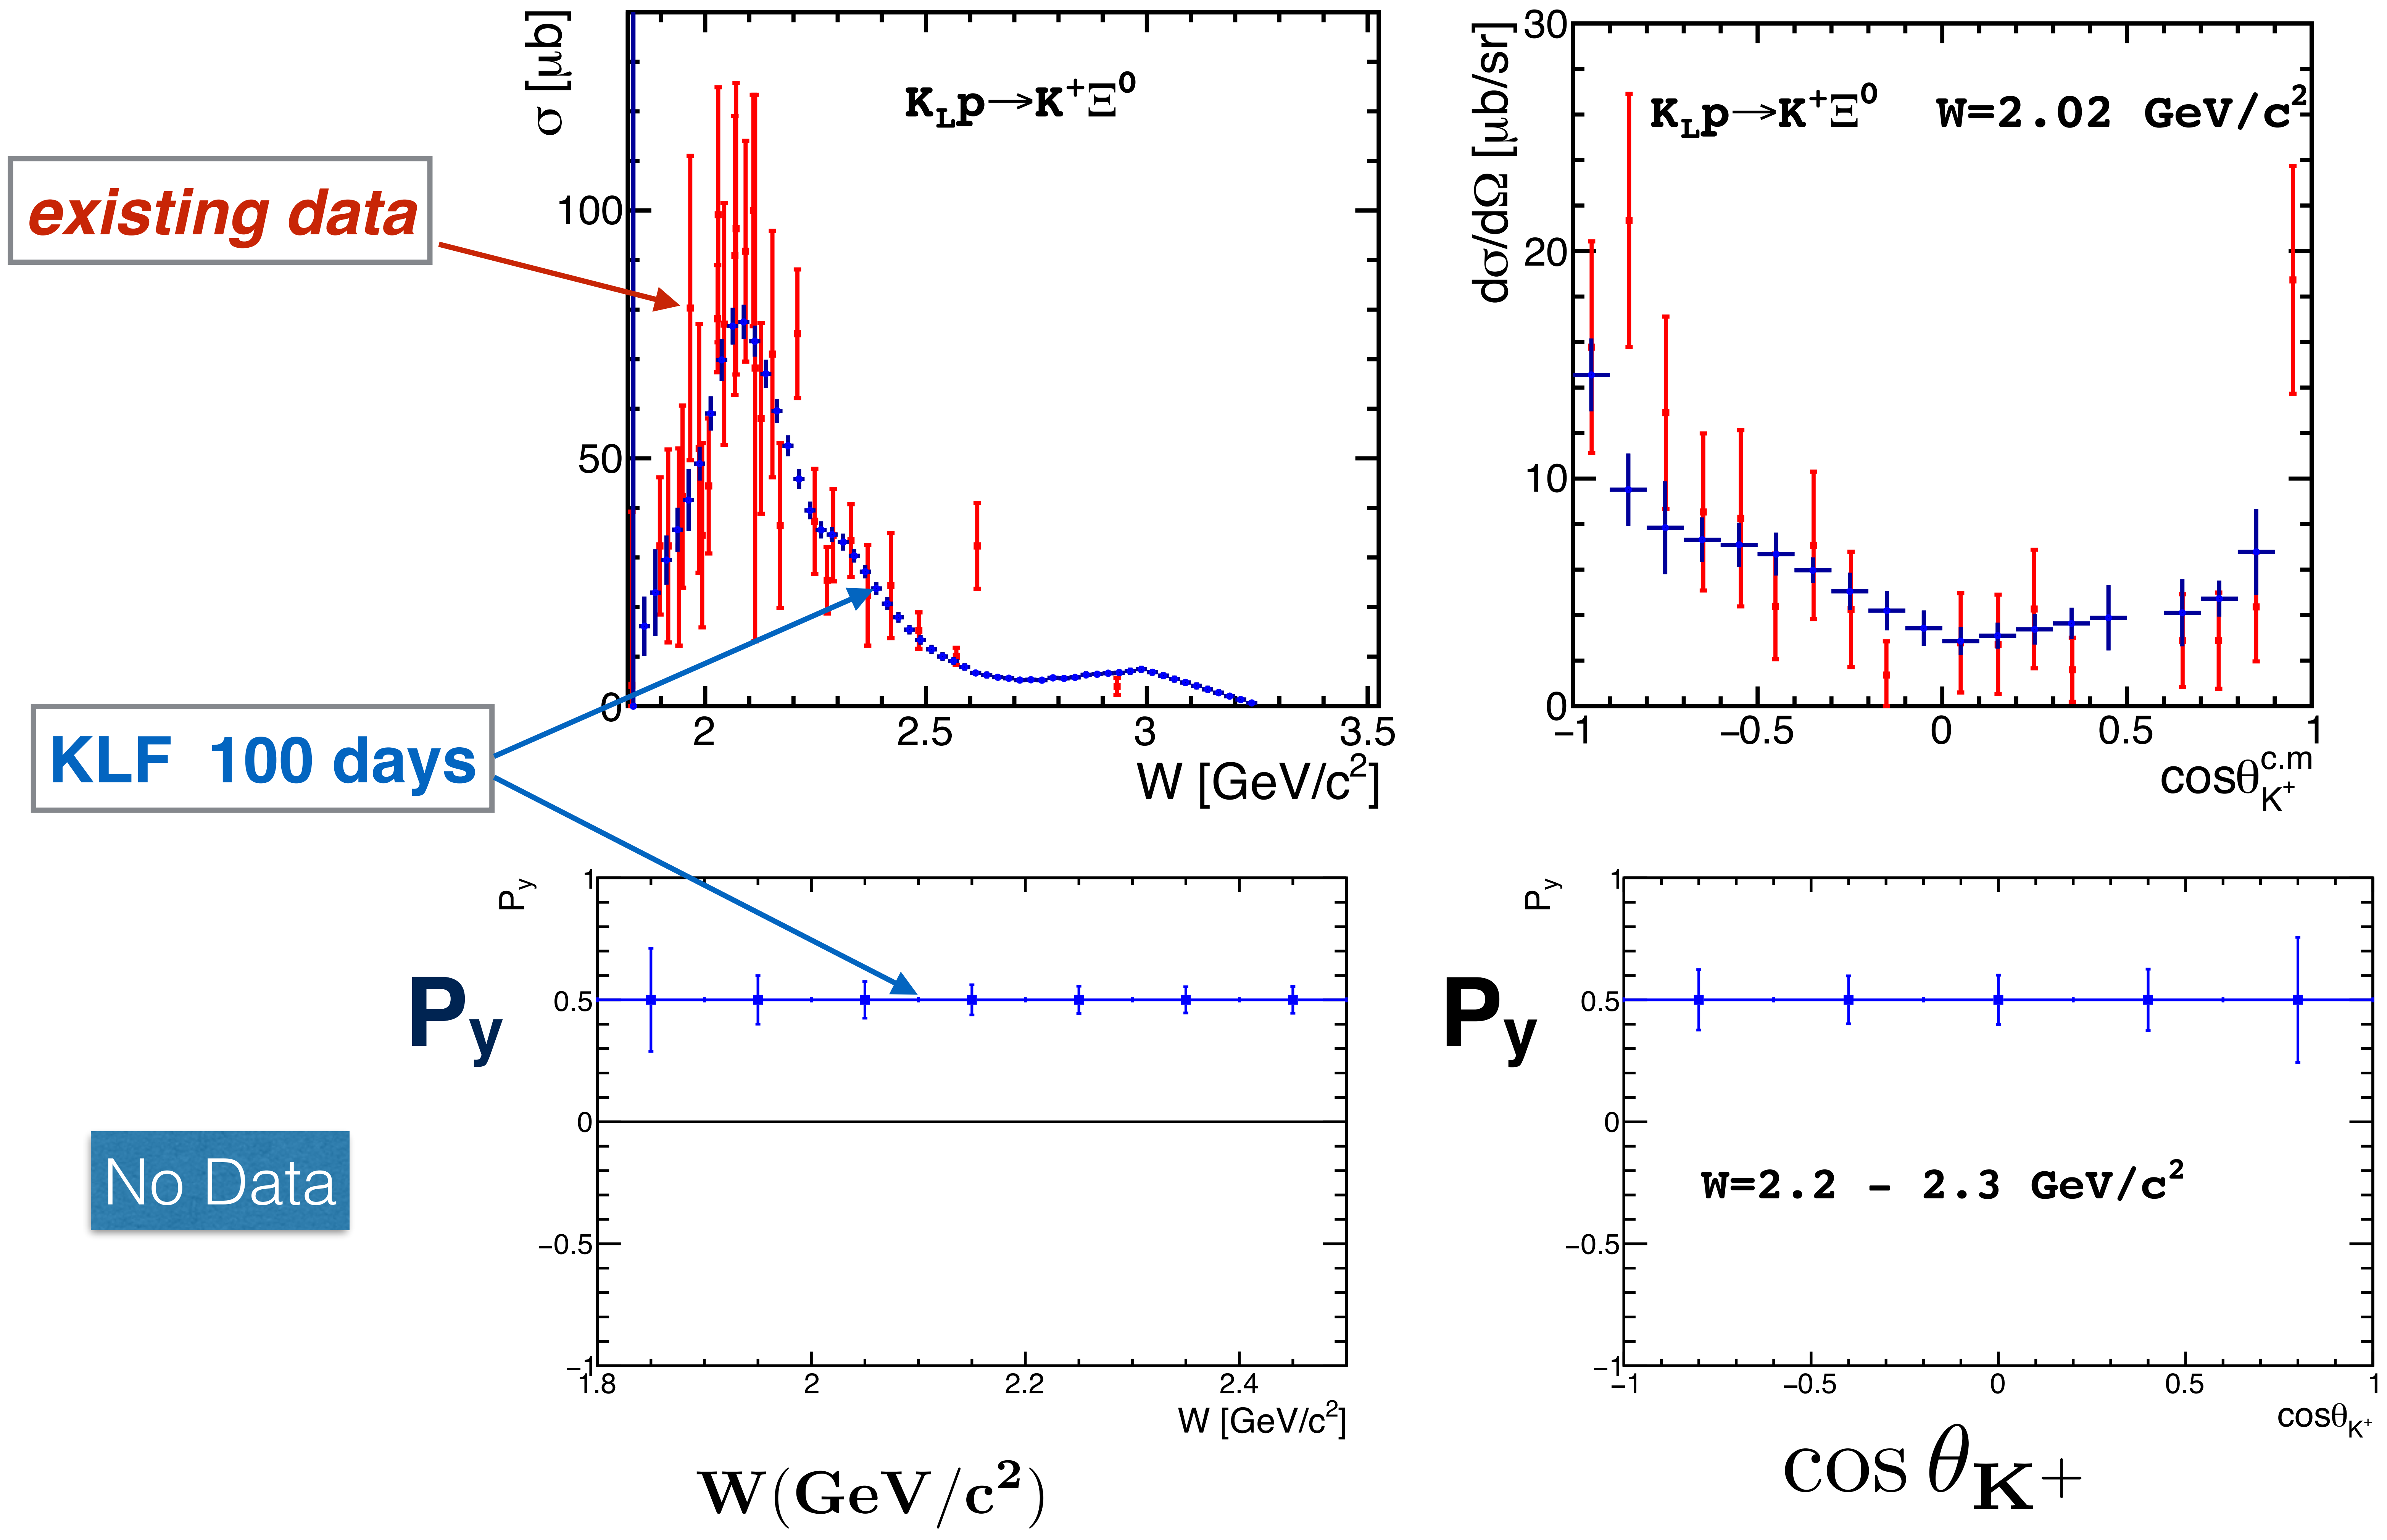
We can do it, but why should we?

- Why to use kaon beam? What is the advantage compared to electrons or photons?
- What is so special about K-long compared to charged kaon beams?
- What is the advantage of producing secondary kaon beam with EM probe, compared to the proton beam?
- How much CEBAF accelerator could make a breakthrough compared to previous results at SLAC?
- Why to do this experiment, what are we going to learn?
- How will it affect our knowledge on hyperon spectroscopy?
- What are we going to learn about strange meson spectroscopy ?
- Many more questions - some constructive and some less so - answers to which shaped the approved proposal.

Measurements on Proton Target



Bonn-Gatchina PWA

Total Cross Section $K_L p \rightarrow K^+ \Xi^0$

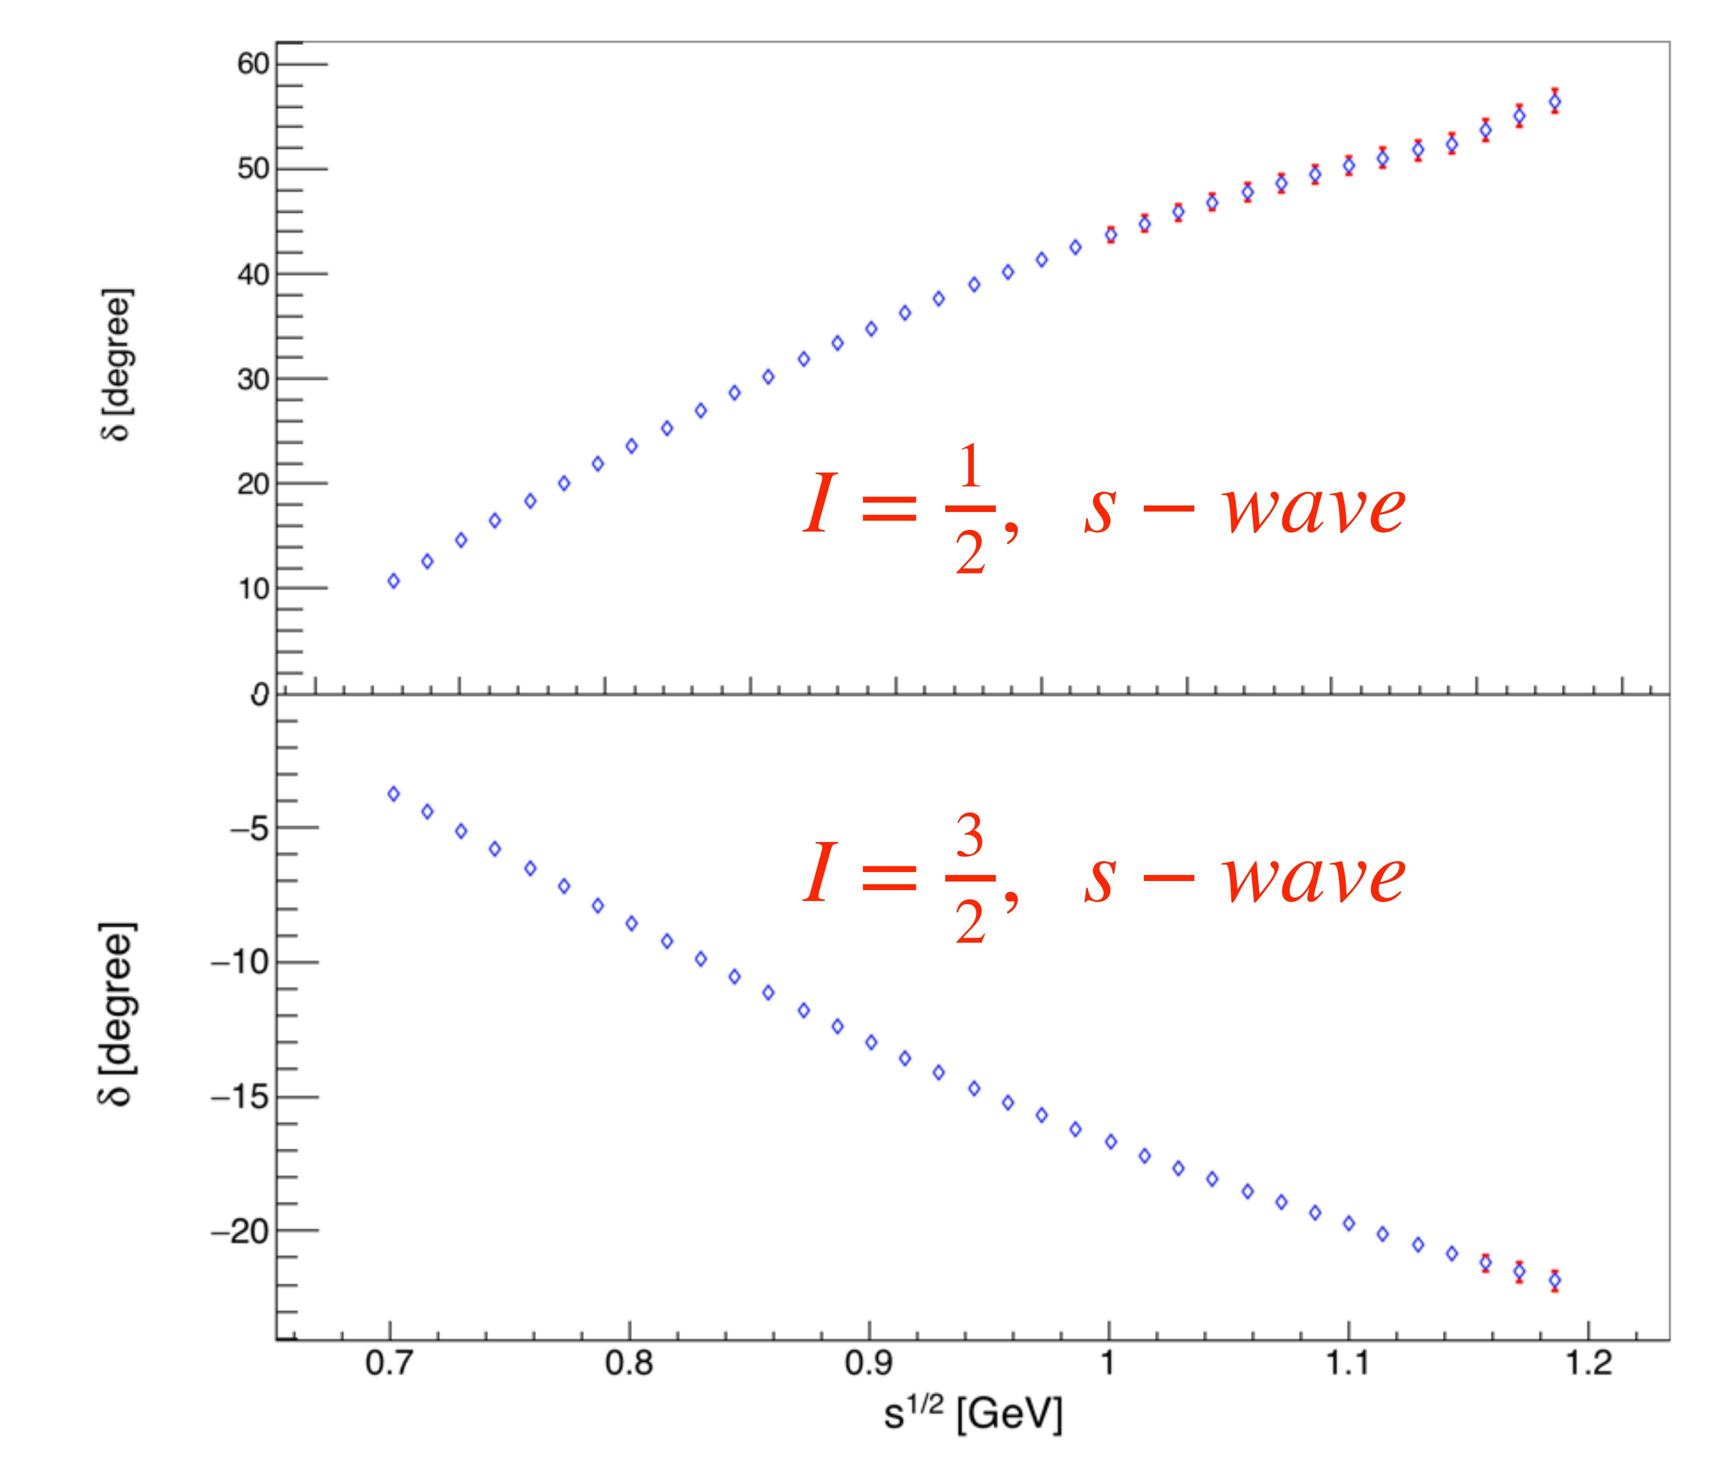
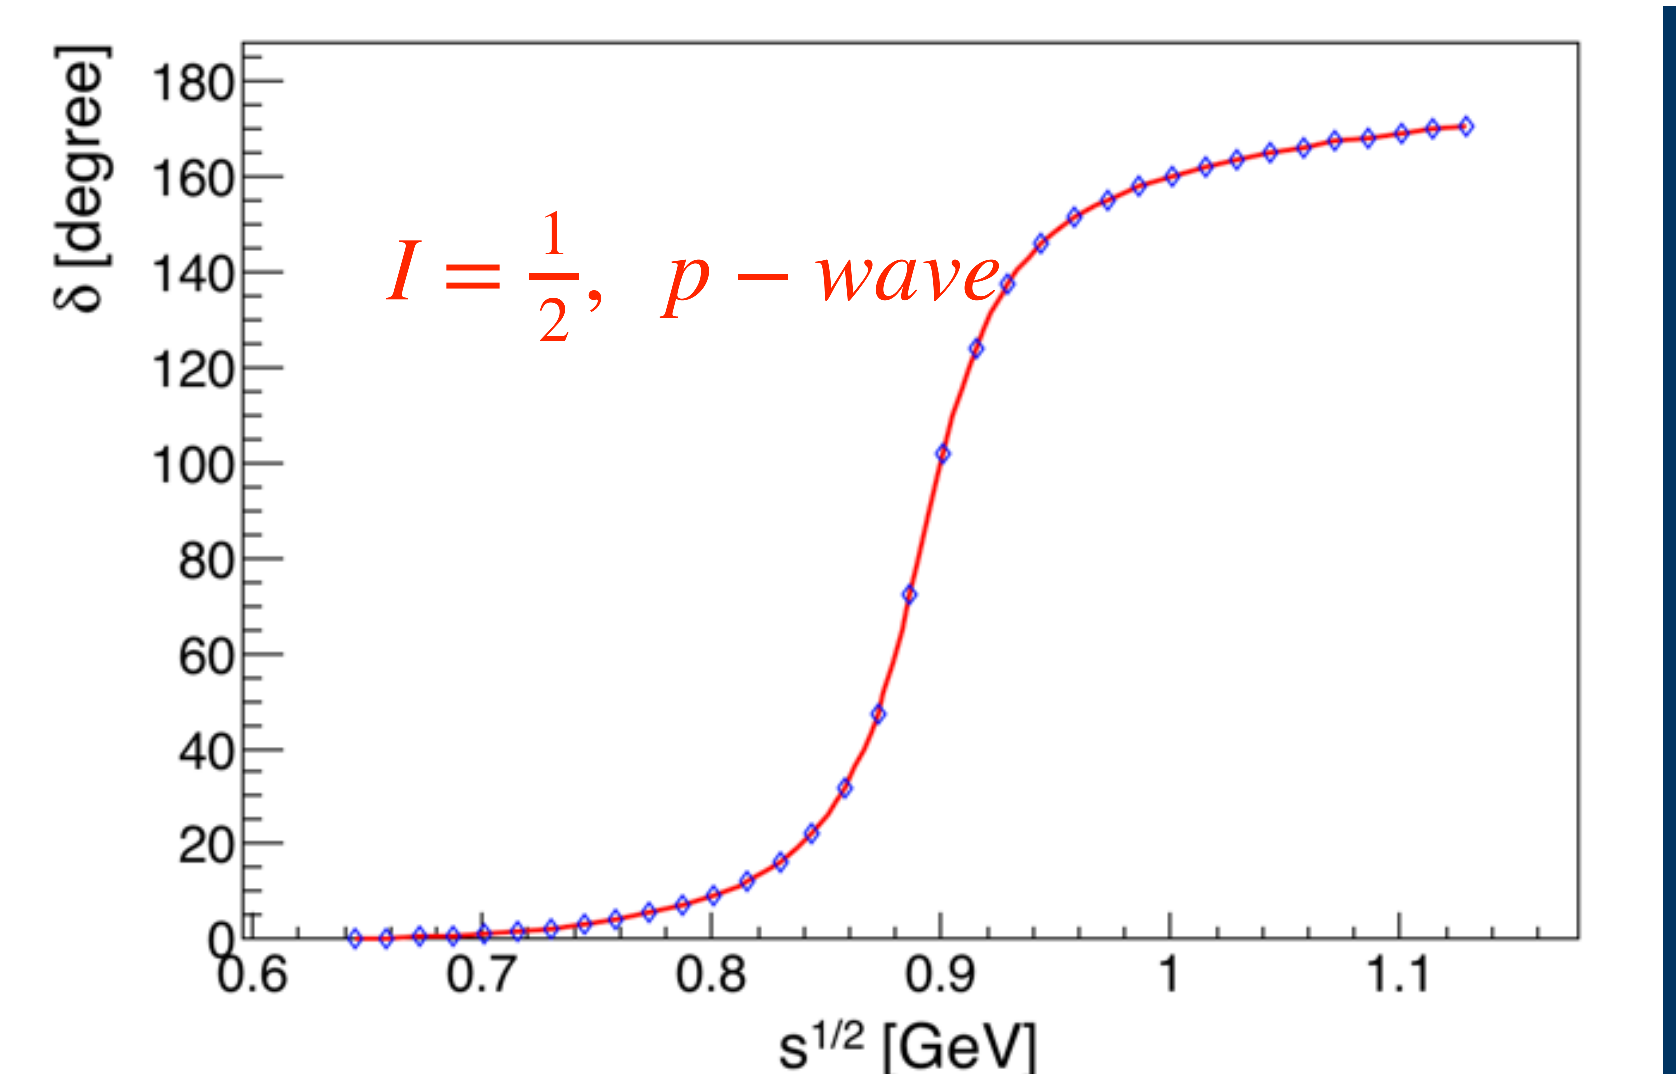
Results include statistical uncertainty only.





Summary of $K\pi$ Scattering

-The KLF will have a significant impact on our knowledge on $K\pi$ scattering amplitudes

-It will improve on still conflictive determination of heavy K*'s parameters

-It will help to settle the tension between phenomenological determinations of scattering lengths from data versus ChPT and LQCD

-Finally, and very importantly, it will reduce the uncertainty in the mass determination of K*(700) and by by more than a factor of two and by factor of five the uncertainty on its width

-It will further clarify debates of its existence, and therefore a long standing problem of the existence of the scalar meson nonet

Date: February 3, 2017

Workshop on Excited Hyperons in QCD Thermodynamics at Freeze-Out (YSTAR2016)

Abstract

This Workshop brought top experts, researchers, postdocs, and students from high-energy heavy-ion interactions, lattice QCD and hadronic physics communities together. YSTAR2016 discussed the impact of "missing" hyperon resonances on QCD thermodynamics, on freeze-out in heavy ion collisions, on the evolution of early universe, and on the spectroscopy of strange particles. Recent studies that compared lattice QCD predictions of thermodynamic properties of quark-gluon plasma at freeze-out with calculations based on statistical hadron resonance gas models as well as experimentally measured ratios between yields of different hadron species in heavy ion collisions provide indirect evidence for the presence of "missing" resonances in all of these contexts. The aim of the YSTAR2016 Workshop was to sharpen these comparisons and advance our understanding of the formation of strange hadrons from quarks and gluons microseconds after the Big Bang and in todays experiments at LHC and RHIC as well as at future facilities like FAIR, J-PARC and KL at JLab.

It was concluded that the new initiative to create a secondary beam of neutral kaons at JLab will make a bridge between the hardron spectroscopy, heavy-ion experiments and lattice QCD studies addressing some major issues related to thermodynamics of the early universe and cosmology in general.

SUMMARY

- -Proposed KL Facility has a unique capability to improve existing world database up to three orders of magnitude
- -In Hyperon spectrosocopy
  PWA will allow to unravel and measure pole positions and widths of a few dozens of new excited states
- -In Strange Meson Spectroscopy
  PWA will allow to measure excited K* states
- To accomplish physics program 200 days running is approved
- All components of KL Facility considered are feasible

  -With total cost of the project below 2M

At the end we would like to invite everyone to join us.

Thanks for your attention!
