

# $\theta$ resolution and HyCal reconstruction

Maxime Levillain

September 28, 2017

- Uniform *theta* resolution

- ▶ width of  $\Delta\theta$  distribution from simulation
- ▶ statistics from data

# x density in HyCal reconstruction

- ▶ Quantity plotted:  $|x_{hycal} - x_{module\ center}| / \text{cell size}$
- ▶ Cuts:  $E > 1 \text{ GeV}$  ( $E_{beam} = 2.142 \text{ GeV}$ ),  $n_{modules} > 4$
- ▶ depends on logarithm weight parameter  $\alpha$

$\alpha = 3.6$

$\alpha = 3.8$

$\alpha = 4.0$

$\alpha = 4.2$

- ▶ corrected variable  $x = x_0 + c(x_0)$
  - ▶ density function  $w(x)$
  - ▶ fit:  $\frac{dw}{dx_0} = P(x_0)$
  - ▶ corrected density:  $\frac{dw}{dx} = 1$
- $c'(x_0) = \frac{1}{P(x_0)-1}$
- 
- ▶ Plan to do it separately for 1GeV/2GeV, data/simulation
  - ▶ Might be energy dependent
  - ▶ Implement it in PRadAnalyzer
