

1 GeV and 2 GeV Cross-Sections

Maxime Levillain

June 16, 2017

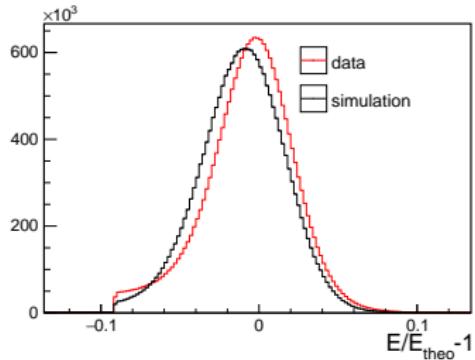

- ▶ event selection according to beam current, target pressure...
- ▶ fiducial cuts:
 - ▶ clusters with center in first and last layers not taken into account
 - ▶ 2.075 cm/3.815 cm around center of dead modules removed
- ▶ single electron (with GEM coordinates):
 - ▶ $\theta > 0.7 \text{ deg}$
 - ▶ $|E_{\text{cluster}}/E_{\text{theo}} - 1| < 4 \cdot 0.024/\sqrt{E_{\text{theo}}}$ (0.065 for LG)
- ▶ double electron:
 - ▶ $\theta > 0.7 \text{ deg}$ or $\theta > 0.6 \text{ deg}$ for hybrid method
 - ▶ $|\Delta\phi - 180| < 5 \text{ deg}$ or $|\Delta\phi - 180| < 10 \text{ deg}$ for hybrid method
 - ▶ $|E_1 + E_2 - E_{\text{beam}}| < 4 \cdot \sqrt{0.024^2 \cdot E_1 + 0.024^2 \cdot E_2}$ (0.065 for LG)
 - ▶ $|z_{\text{vertex}}| < 150 \text{ mm}$ for GEM coordinates or $|z_{\text{vertex}}| < 500 \text{ mm}$ for hybrid method
 - ▶ then single electron selection with GEM coordinates

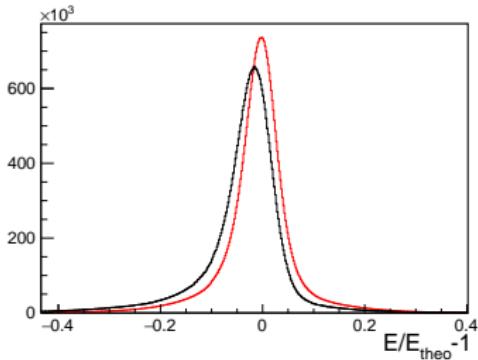

Distributions for 1 GeV

PROton
Radius

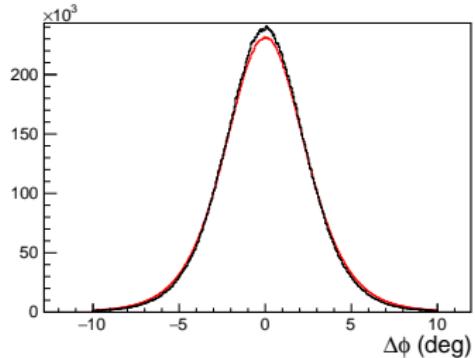

ep elasticity

ee elasticity

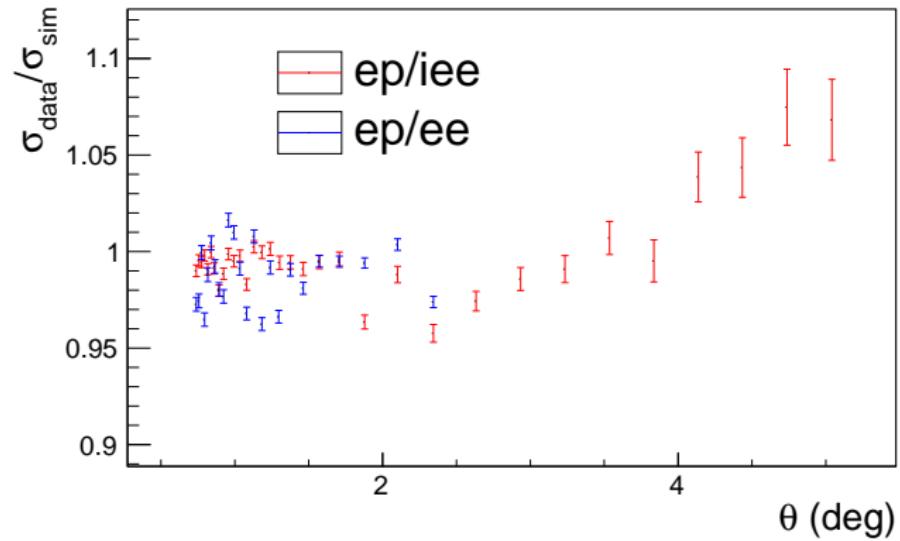

$\Delta\phi$

- ▶ Some calibration is needed for 1Gev simulation
- ▶ Re-getting some constant from snake scan in progress

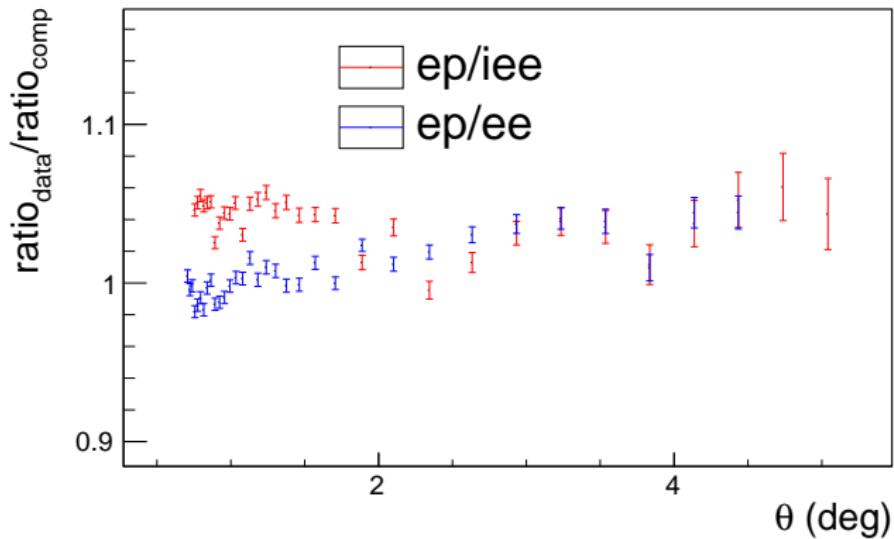

Ratio data/simulation 2GeV

PROton
Radius

Ratio data/simulation 1GeV

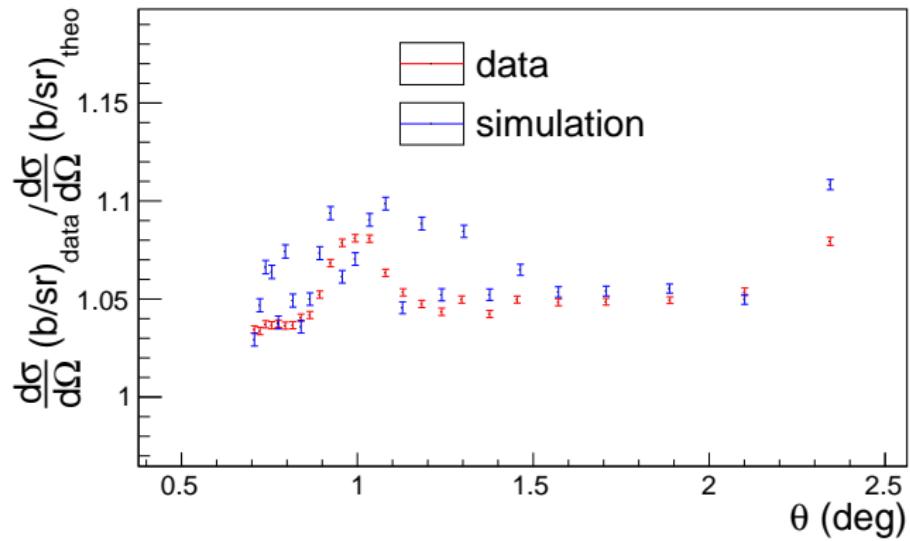

PROton
Radius

- ▶ Ratio integrated corrected with 2GeV GEM efficiency that explains the difference at low angle

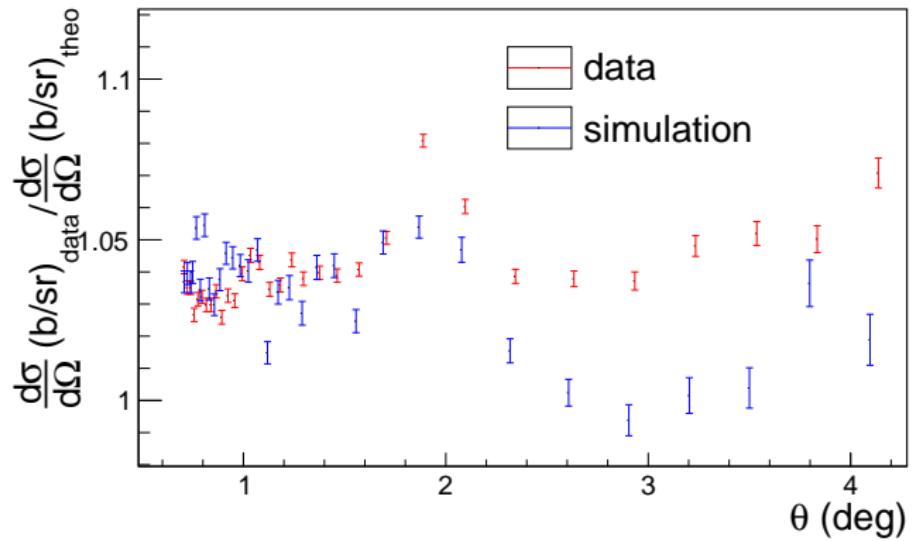

Ratio data or simulation over theory 2GeV

PROton
Radius

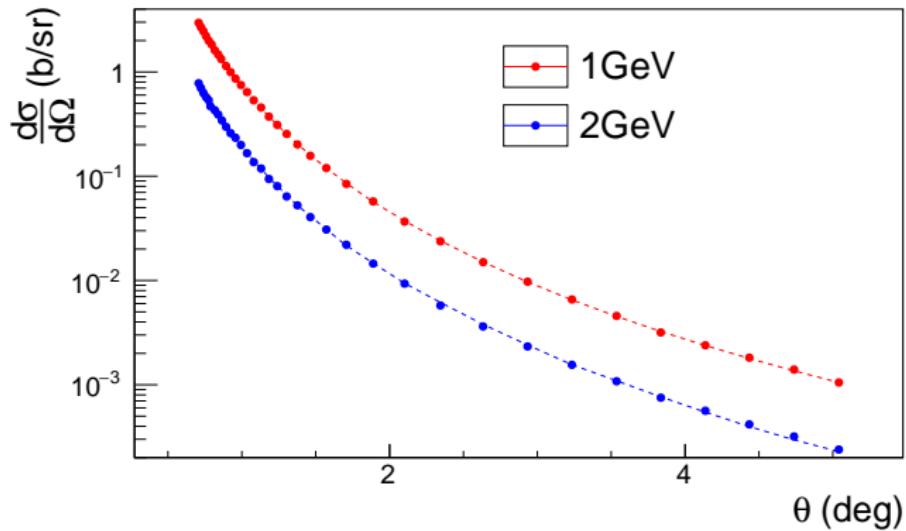

Ratio data or simulation over theory 1GeV
