

## $\theta$ resolution and HyCal reconstruction

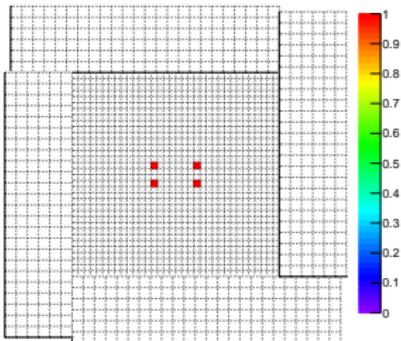

Maxime Levillain

October 6, 2017

# Reconstruction Correction

- ▶ Method and functions taken from A. A. Lednev, NIM Physics Research A 366 (1995) 292-297)
- ▶ correction of reconstruction on the variable
$$x_0 = (x_{rec} - x_{center}) / \text{size}_{cell}$$
- ▶ corrected variable  $x = x_0 + c(x_0)$
- ▶ summation of 4 symmetrical modules to cancel out the physical distribution shape both in x and y coordinates

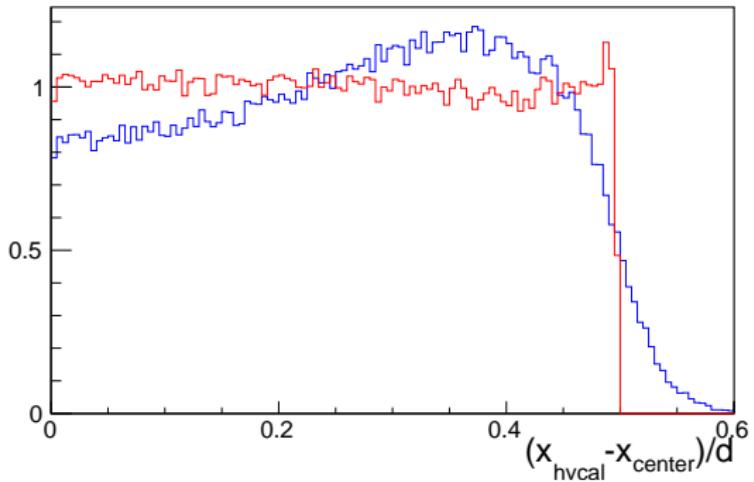

# Correction Function

$$c(x_0) = a \cdot x_0 \cdot (x_0^4 + b \cdot x_0^2 + c) \cdot (x_0^2 - 1/4) \cdot (x_0^2 - q) \quad (1)$$

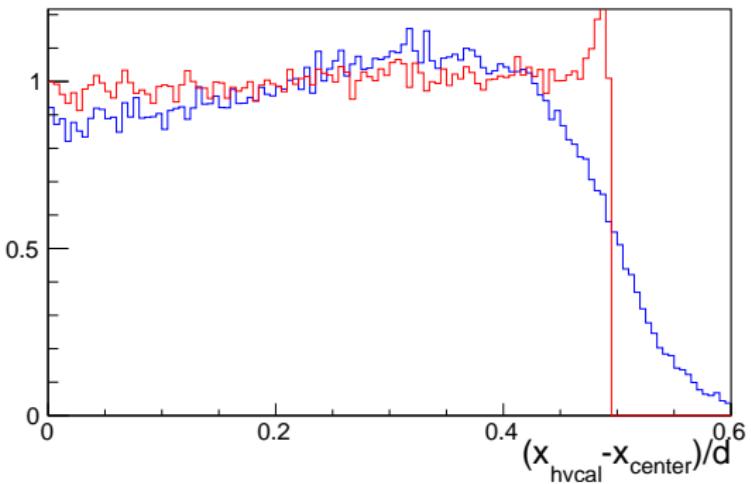

- ▶ density function:  $f_{X_0}(x_0) = 1 + c'(x_0)$
- ▶ Fit raw density function between 0 and 1/2 with:  $1 + c'(x_0)$
- ▶ Rough table for 2 GeV:

	$1500 < E$	$500 < E < 1500$	$100 < E < 500$
a	-40	-30	-0.5
b	0.3	0.07	0.3
c	0.1	0.1	0.2
q	0.15	0.08	-4

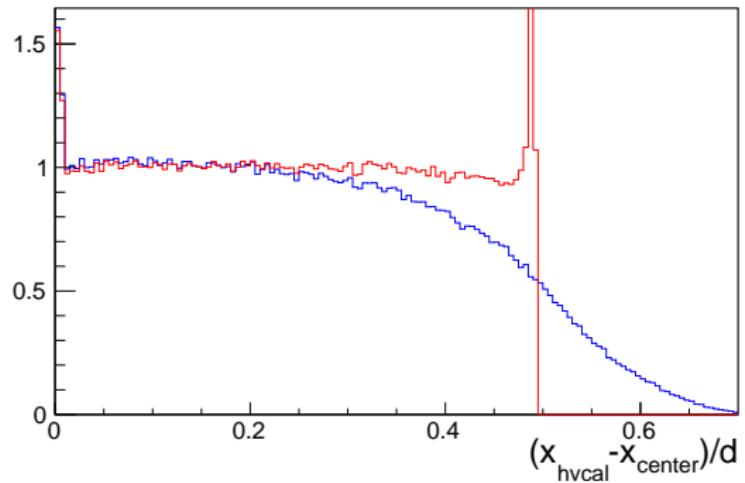

# Results for $E > 1500$ MeV

# Results for $500 < E < 1500$ MeV

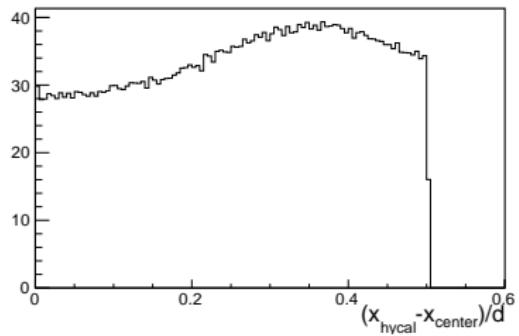

# Results for $100 < E < 500$ MeV

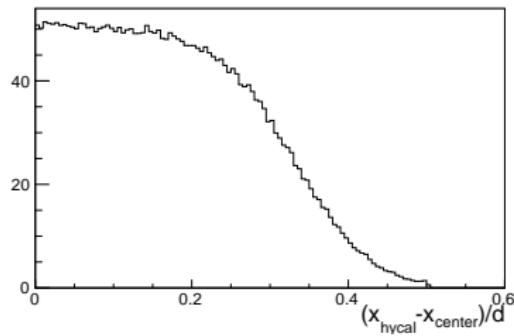

# Change of log parameter for $E > 1500$ MeV

PROton  
Radius

4.2

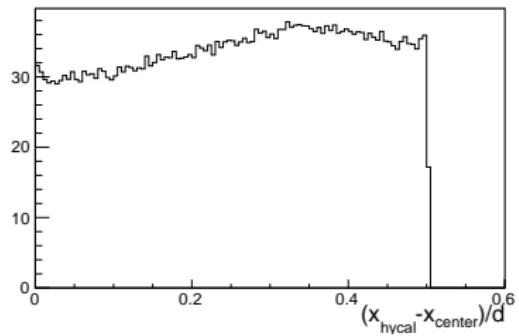

6.0

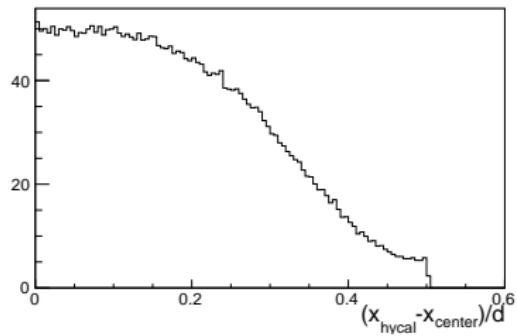

# Change of log parameter for $500 < E < 1500$

Proton  
Radius

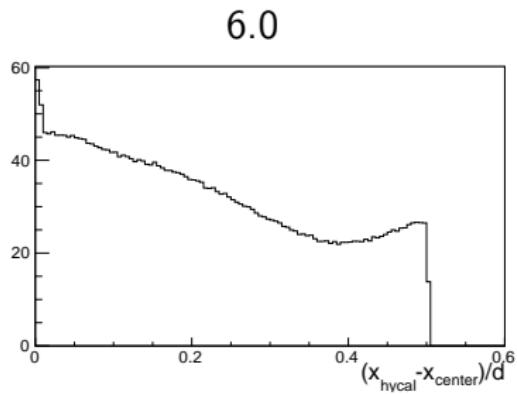

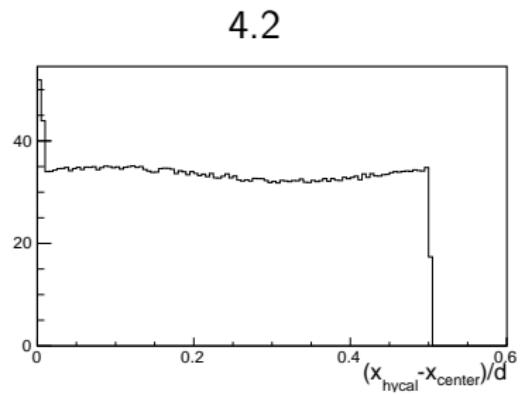

4.2

6.0

# Change of log parameter for $100 < E < 500$ MeV Proton Radius

- ▶ Change minimum module energy (might take long reconstruction)
- ▶ Solve the edge problem at the edge for lower energy (Probably just need ID reassignment)
- ▶ More refined binning for E (more statistics)
- ▶ Binning on theta, and closer look at transition and edges
- ▶ Do it for 1 GeV and simulation
