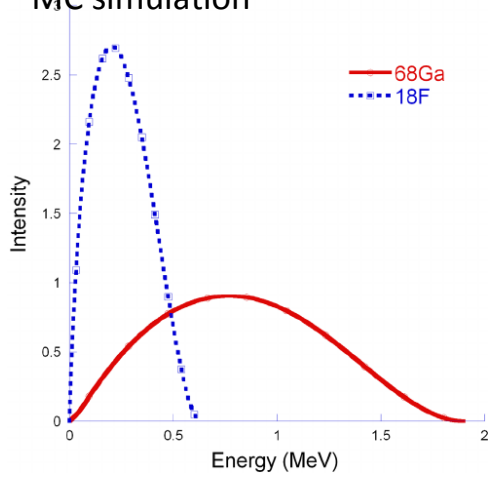
Positron Applications at JLab

- MeV Positrons
  - Bulk Ferromagnetic properties of Material
  - Paramagnetic Defects in Semiconductors
- Slow (< 100 keV) Positrons
  - Positron Annihilation Spectroscopy
  - Ferromagnetic properties on surfaces and interfaces
  - Atomic spin structure in films (spintronics)
- Moderating positrons
  - Solid neon
  - Tungsten

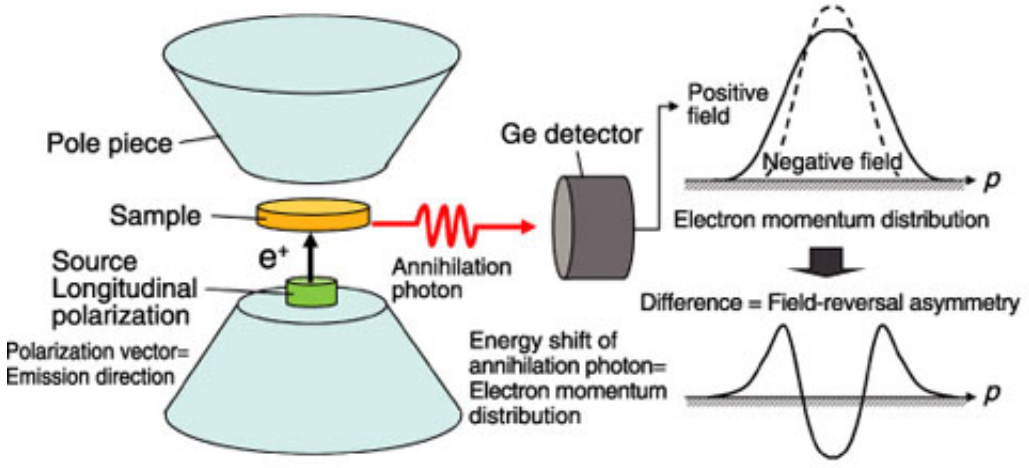
MeV Positrons (PPAS)

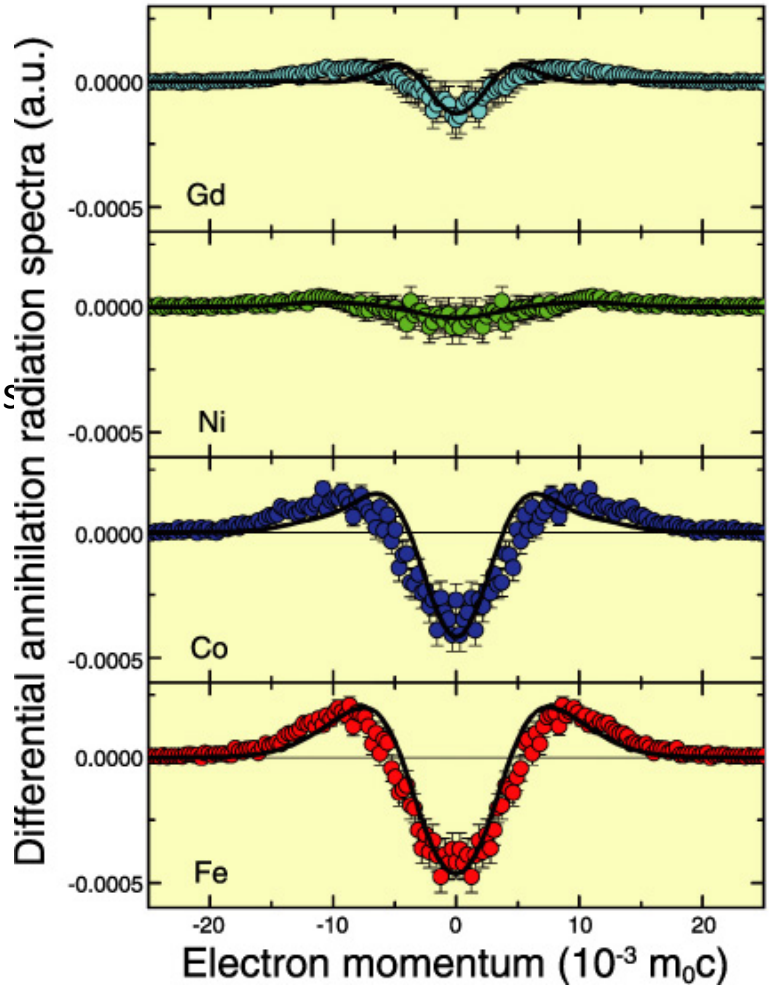
MC simulation



20 MBq Ge-68 source made from proton irradiation of Ga-69

70% polarized positrons from Ge-68



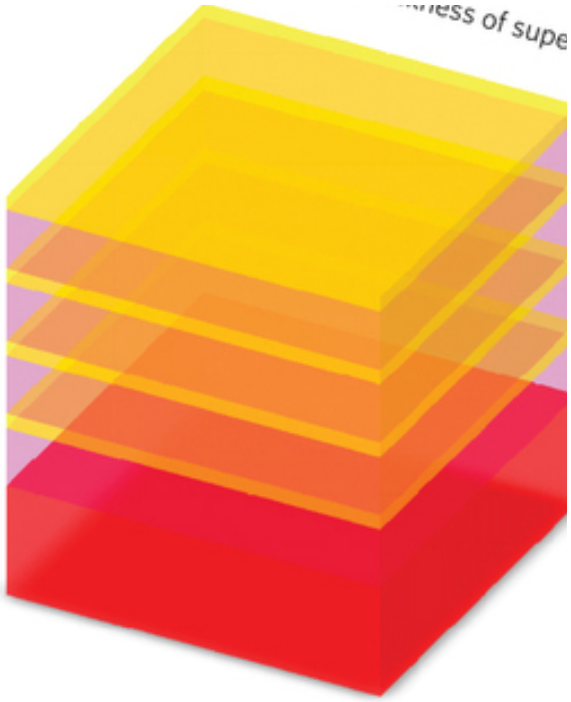


PHYSICAL REVIEW B **83**, 100406 (R) (2011)

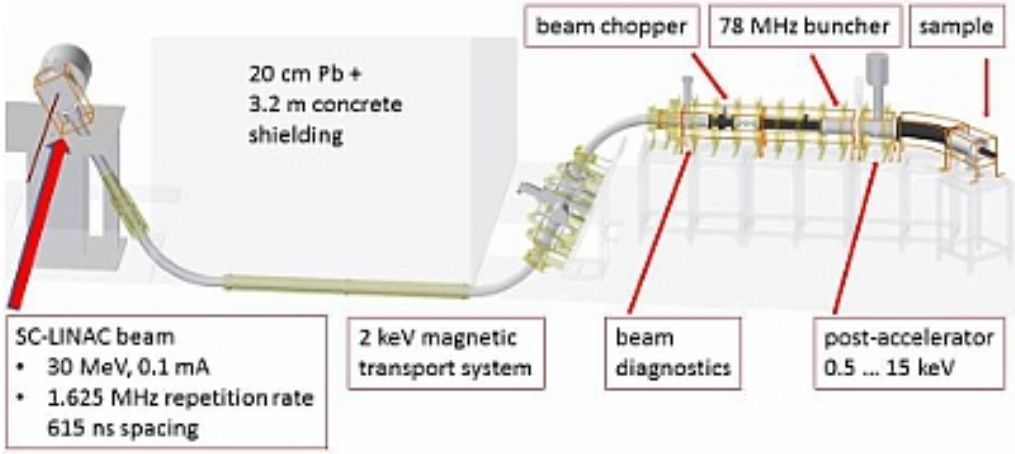
polarized electrons are directly detected through annihilation with polarized positrons. This is an important feature for the investigation of polarized electron states

Slow Positrons

Nature Materials 12, 392 (2013)



MePs positron beam at HZDR, Germany



Defects at the interface induce novel electronic phenomena triggering new devices

Depth defect profiling by positrons is crucial to study these surfaces and interfaces

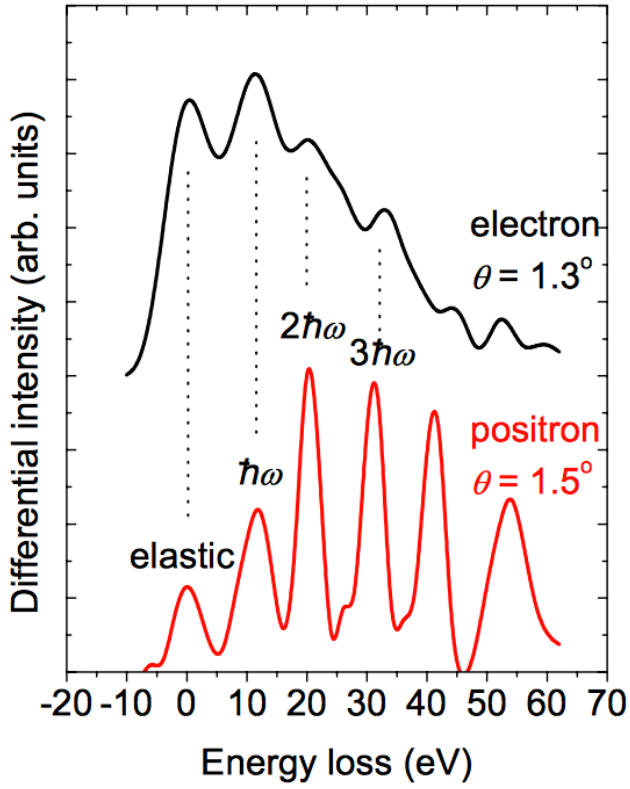
Slow Positrons

Reflection High Energy Positron Diffraction

- 1 fA positron beam from the Slow Positron Facility KEK LINAC
- 10-20 keV
- 8 MeV energy spread
- 100 nm-thick W foil moderator + Magnetic Lens

Reflected positrons excite more surface plasmons than electrons

Surface Plasmons



Journal of Physics: Conference Series **443** (2013) 012068

Moderators

Can a moderator be used to slow High energy Positrons (MeV) to slow positrons (<40 keV)?

W foils moderating fast (100 keV) Na-22 positrons to eV energies

Solid Neon (6.8 Kelvin) moderator with a 40 mCi Na-22 source yields 5×10^6 positrons/sec (can have x2 higher efficiency than W

How could Jlab moderate positrons?
