

Update!

Attempting to work on a universal Ar-replay on the farm this will then be modified for Tritium.

Shell script to request a run to be retrieved from tape.

- `get_raw.sh` or `get_raw.sh run#`
- The raw root file will be stored in `/cache`
- Forcing the replay script to use the DB provided in the directory.
- I will attempt to keep the DB up to date, from gitup

To use

- In order to force the use of the current DB, there is a kill switch in the replay code.
 - Use “replay.sh” to change to the correct DB. This will also begin the replay script.
 - You can use a run number as an argument.
 - I am having an issue get the “max event” argument also working, but having a small issue with it.
- Small issue: I can not figure out how to make the Gmp libraries work for everybody without compiling them.
 - You can compile them individually or use the script libs.sh to compile all the libraries in the libraries directory.
- Please in your spare time try to test its usability: Read the ReadMe
 - If it does not work, please let me know. If you fix anything THANK YOU. Let me know what you did!

```

ifarm1101>
ifarm1101> pwd
/lustre/expphy/work/halla/triton/Ar_replay
ifarm1101>
ifarm1101>
ifarm1101>
ifarm1101> ls

```

```

ifarm1101>
ifarm1101> sh get_r
get_raw.sh~* get_raw.sh*
ifarm1101> sh get_raw.sh 762
get request: 7871768
status: pending
/cache/halla/Ar40/raw/Ar40_762.dat.0 -> pending

```

Send email to the user's jlab email:

The file will be added to the cache:
/cache/halla/Ar40/raw/Ar40_run#.dat.0

An email will be sent to your jlab user name @ jbane@jlab.org once the 762 file has been added to the cache

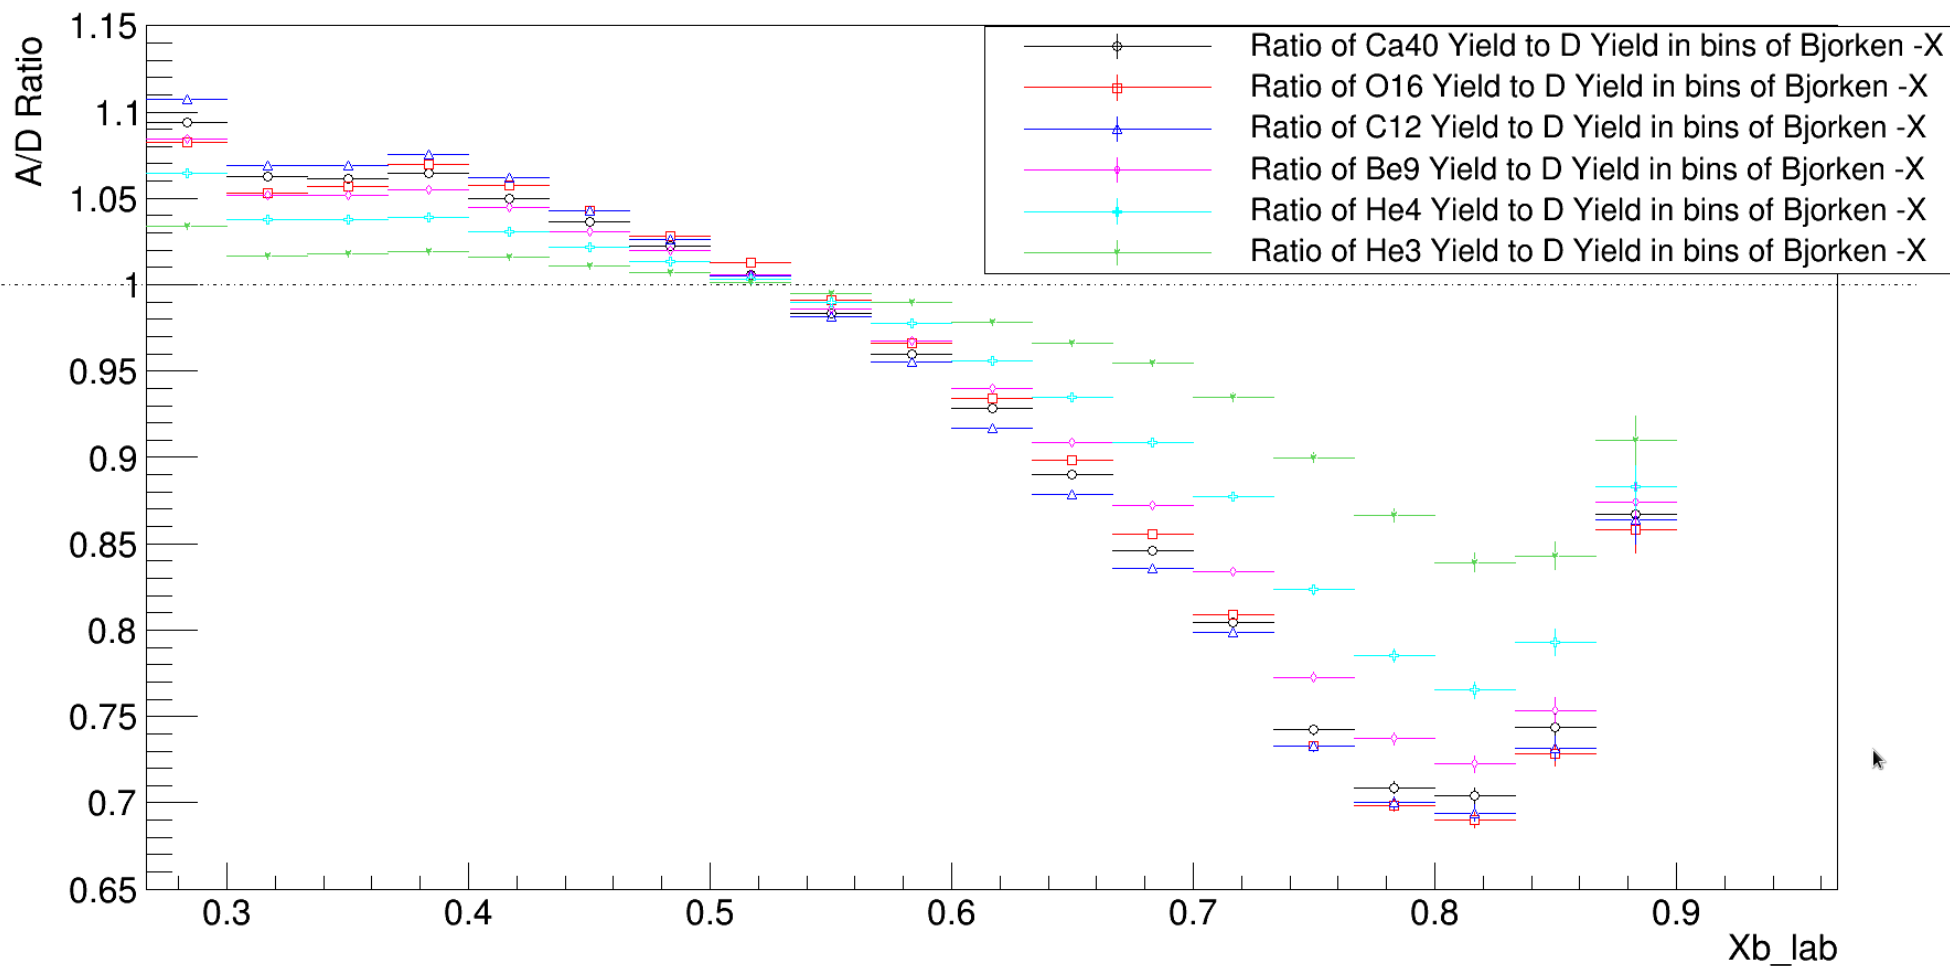

If you would like to have the script. It should work in any directory once you copy it.

You may also add this alias to your shell log in file

```
alias get_raw "/lustre/expphy/work/halla/triton/Ar_replay/get_raw.sh \"\!:1\""
```

EMC simulation

Ratios of simulated Yield in bins of Bjorken-X

Cut on High Momentum

Momentum Distribution

EMC simulation

Ratios of simulated Yield in bins of Bjorken-X with high momentum Protons($k > 0.25$ GeV)

Results: Exp R:
 C12/D ~ 4 ~3.6
 Be9/D ~ 3.3 ~2.8
 He4/D ~ 2.5 ~2.6
 He3/D ~ 1.4 ~1

I was working on getting A more accurate value for this, but lost the rootfiles on volatile. I am currently working on reproducing my missing rootfiles.

Experimental results from Nadia Fomin: arXiv:1209.1621

Pulled from graph – values for a_2 are approximations

a_2 = ratio of A/D cross sections in the high-momentum region

Data from E12-06-105
